MONTHLY LABOR REVIEW

U.S. Department of Labor
Bureau of Labor Statistics
January 1980

In this issue
State Labor Law
Changes in 1979

L2.6:

U.S. DEPARTMENT OF LABOR
Ray Marshall, *Secretary*

BUREAU OF LABOR STATISTICS
Janet L. Norwood, *Commissioner*

The Monthly Labor Review is published by the Bureau of Labor Statistics of the U.S. Department of Labor. Communications on editorial matters should be addressed to the Editor-in-Chief, Monthly Labor Review, Bureau of Labor Statistics, Washington, D.C. 20212. Phone: (202) 523-1327.

Subscription price per year
$18 domestic; $22.50 foreign.
Single copy $2.50.
Subscription prices and distribution policies for the Monthly Labor Review (ISSN 0098-0818) and other Government publications are set by the Government Printing Office, an agency of the U.S. Congress. Send correspondence on circulation and subscription matters (including address changes) to:
Superintendent of Documents,
Government Printing Office,
Washington, D.C. 20402.

Make checks payable to
Superintendent of Documents.

The Secretary of Labor has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through October 31, 1982. Second-class postage paid at Riverdale, Md. and at additional mailing offices.

Library of Congress Catalog
Card Number 15-26485.

MONTHLY LABOR REVIEW

JANUARY 1980
VOLUME 103, NUMBER 1

Henry Lowenstern, Editor-in-Chief
Robert W. Fisher, Executive Editor

N. Root, D. McCaffrey 3 **Targeting worker safety programs: incidence vs. expense**
Case data for three States show that accidents selected for safety programs will be the same, whether chosen from the costliest or most frequent cases

Edward Wasilewski 9 **Scheduled wage increases and escalator provisions in 1980**
For the third straight year, deferred increases will average 5.1 percent, and will go to 4.9 million workers; cost-of-living clauses in major agreements will cover 5.5 million

Gregory J. Mounts 14 **Labor and the Supreme Court: significant decisions of 1978-79**
The Court approved voluntary efforts to eliminate the effects of discrimination and rejected NLRB attempts at balancing conflicting interests in the workplace

Richard Nelson 22 **State labor legislation enacted in 1979**
During a heavy legislative year, States prohibited most types of job bias and eased child labor restrictions and mandatory retirement requirements

REPORTS

Arthur S. Herman 40 Productivity increased in 1978 in most measured industries

Labor Month In Review

STATE OF THE UNIONS. Two seasoned observers of trade unions offered assessments of the U.S. labor movement during the year-end meeting of the Allied Social Science Associations in Atlanta.

A. H. Raskin, long a *New York Times* labor affairs writer and now associate director of the National News Council, was dismayed about labor's "standpattism:"

"The best thing the American trade union movement has going for it is the near-hopelessness of its current position. Organized labor is on the skids in economic, social and political power; and a strong argument can be made that that is exactly where it deserves to be, given the assiduousness with which labor has helped spread the banana peels that are speeding its downhill slide. . . .

"Familiar as the alarm signals must be to this sophisticated audience, bear with me for a bit as I tick off a few of the more menacing evidences of union decline. Foremost, of course, is the steady fall-off in the proportion of the nonfarm work force in union ranks, from one out of three at the time of the AFL-CIO merger in 1955 to one out of four today.

"Industry is moving out of the union heartland in the Northeast and Middle West to the right-to-work States of the Sunbelt and to low-wage sanctuaries in the Far East and Latin America. . . .

"The pursuit of more remains as solidly the centerpiece of unionism's design for living as it was when Samuel Gompers first enshrined it almost a century ago. Yet ingrained inflation makes a mockery of that chase by devouring union-negotiated wage increases before workers can get to the supermarket to spend them. In the 1970s, the average weekly wage for all employees nearly doubled, from $114 to $224; yet the average worker with three dependents wound up the decade with a 3.5-percent cut in what his pay envelope could buy after the bite of higher living costs and taxes.

"It is true that the entrenched unions in auto, steel, and other administered-price industries have stayed well ahead of the parade, but their insulated position has created its own compass of problems. Their industries are losing ground in world trade competition. The causes extend far beyond labor, yet the necessity for cost-cutting will force these industries to seek payroll relief in ways that will differ in character but not in effect from those that are making orphans of the storm of the construction crafts, once the undisputed champions in grab-with-both-hands unionism."

Jerome M. Rosow, a former U.S. Assistant Secretary of Labor, and current president of the Industrial Relations Research Association, cited three areas in which unions must be more responsive to the people they serve.

"Women have moved into the labor force in record-breaking numbers in recent years with the result that over 41 percent of the working population today is female. Yet only one in four union members is a woman. The discrepancy is not surprising, since labor union membership today continues to be concentrated in the traditionally male blue-collar occupations; women, on the other hand, predominate in the so-called "helping" occupations, which the labor movement has been slower to organize. If labor unions are to tap this new and growing pool of workers for membership, a twin agenda will be required. First, unions will have to be responsive to the unique and growing role of women in the work force. . . . Second, unions should think in terms of opening up their membership to women.

"The interest of both blacks and Hispanics in unionization is evidenced by their higher participation rates: 29 percent of Hispanic workers and 33 percent of black workers are represented by labor unions as compared to 26 percent of white workers. . . . To counterbalance the requirements of its energy-hungry neighbor to the North, Mexico, it is believed, will demand an escape valve for its crushing overpopulation, forecast to almost double by the year 2000. Thus a new underclass of workers may well flood the labor markets as the energy/employment tradeoff grows in importance. Labor will have to decide whether to try to stem the tide—or to sign up the new workers, legal or illegal.

"Some unions, in industries with a predominantly immigrant work force, have already made the decision. It is reported that several of these unions—in garment making, food and services, and light manufacturing—are signing up aliens without regard to their legal status, to eliminate a source of cheap labor and to prevent the undercutting of union contract wage levels.

"Increasing education, changing values, and the strong urge to move up the socioeconomic ladder make it more difficult for unions to respond to the needs of white-collar office and professional workers. Many of these educated and upwardly mobile employees are difficult to organize because they tend to identify with management and feel that they would lose the esteem of others if they became card-carrying union members." □

Targeting worker safety programs: weighing incidence against expense

Case data for three States show that accidents selected for safety programs will be the same, whether chosen from the costliest or most frequent cases

NORMAN ROOT AND DAVID MCCAFFREY

Increasing costs associated with work-related injuries and illnesses—rising outlays for direct compensation and medical payments, and increasing premiums for workers' compensation insurance[1]—have set many firms seeking effective, cost-reducing safety programs. In undertaking these efforts, safety professionals are faced with deciding how to plan programs that will best reduce these increasing costs. Two possible approaches emerge: sorting out the costliest cases, the "expensive case" approach, or targeting the most frequent, the "general frequency" approach.

Which approach is better? Analysis of case characteristics and costs can identify whether relatively few cases account for most of the expense and, if they do, whether the distribution of these few differs from the overall distribution of cases among certain descriptive categories.

This article presents the distribution of incidence and costs of indemnity compensation cases among kinds of occupational injuries and types of accidents for three States.[2] The data indicate that, although a small number of cases accounted for a large proportion of the costs and certain categories resulted in costlier cases, the targets selected for safety programs would essentially be the same, whether chosen from a list of the most expensive cases or a list of the most frequent. The data also support the hypothesis that any type of accident can result in an expensive case.

Underlying logic

Proponents of the expensive case approach point out that a large percentage of the costs associated with occupational injuries over any period are accounted for by a relatively small number of cases.[3] Thus, identification of these types of cases will pinpoint the costly areas and direct safety workers to specific accident prevention programs. For example, if a firm's workers have had amputations or serious falls in the recent past, the firm will concentrate prevention efforts based on the characteristics associated with these specific types of cases. Adherents claim this approach reduces major costs, marshals resources efficiently, and avoids diffusing safety efforts over many different, less expensive, or "trivial" problems.

Underlying the general frequency approach is the concept of a range of injury severity for any type of accident. That is, every accident has the potential for resulting in a serious (expensive) injury.[4] For example, a falling hammer can result in a near miss (no injury), a glancing blow to the arm (minor injury), or a crushing blow to the head (major injury). This logic contrasts with the expensive case approach in an important respect: the general frequency approach accepts the fact that a small number of injuries account for a large proportion of the costs but does not accept the proposition that these cases can be singled out for accident preven-

[1] All closed cases for which indemnity payments were made in 1976, regardless of when cases occurred. "Accidents" also includes injuries, illnesses and exposure.
[2] The most expensive 10 percent of all accident cases.
[3] Total cases equaled 9,003 in Arkansas, 25,036 in North Carolina, and 52,440 in Wisconsin.
NOTE: Column percentages may not add to totals because of rounding.

tion efforts because, as noted above, any type of accident can conceivably result in an expensive case. Furthermore, over time, expensive cases will be spread proportionately among all types of cases. Adherents maintain that safety efforts should be sustained, overall programs directed at preventing *all* injuries or illnesses, with proportionate efforts in the largest identifiable areas of risk. By reducing the total number of events, these programs would reduce the chance of a serious injury occurring in any of the categories.

Data sources and methodology

Data in this article are from the Bureau of Labor Statistics' Supplementary Data System.[5] This system obtains data from records of cases reported to State workers' compensation agencies. The cases are coded for nature of injury or illness, part of body affected, source of injury or illness, type of accident or exposure, and, for some States, the indemnity compensation and medical payments associated with the case.[6]

The three States chosen for comparison were Arkansas, North Carolina, and Wisconsin. They were selected because data for them were available, and because geographic dispersion made them highly representative of the Nation. The data are from all closed cases for which indemnity payments were made during 1976, regardless of the year in which the cases occurred. Arkansas and North Carolina require 7 days of disability before awarding indemnity compensation. In Wisconsin, there is a 3-day waiting period for such benefits.

Table 2. Distribution and rank of the costliest work-related injury cases, and of all cases, in Arkansas, North Carolina, and Wisconsin, by part of body affected, 1976[1]

[1] See table 1, footnote 1.
[2] See table 1, footnote 2.
[3] See table 1, footnote 3.
NOTE: Column percentages may not add to totals because of rounding.

Case records, classified according to the American National Standards Institute's Z16.2 code system (see footnote 6) were sorted in descending order of total costs of indemnity compensation and medical payments and ranked by frequency. For each State, the most expensive 10 percent of all the cases were compiled (900 cases for Arkansas, 2,503 cases for North Carolina, and 5,244 cases for Wisconsin).

Analysis focused on the distribution of four case characteristics: nature of injury, part of body affected, source of injury, and type of accident. For each State, the categorical distributions of the most expensive 10 percent of cases were compared to the distributions of all State cases to determine whether the characteristics of the most expensive cases were different from those of all cases.

Although "unclassified," "unidentified," or "multiple category" cases were included in the tables, they were not included in the rankings unless *some* description of the case was given (for example, "metal items, not elsewhere classified"). This is because a safety program cannot target an "unclassified" or "unidentified" case.[7]

Examining accident characteristics

The data confirm that a small minority of cases accounted for a large percentage of costs. The most expensive 10 percent of cases accounted for 60 percent of the cost in Arkansas, 58 percent in Wisconsin, and 55 percent in North Carolina. The most expensive groupings were examined by characteristics. Then the dispersion of each characteristic for the groupings was compared to the distribution for all cases in each State.

One of the most critical elements to identify for an accident prevention program is the type of accident. (See table 1.) This category describes how the person contacted the source of injury, thereby indicating the events that must be prevented.

In Arkansas's costliest 10 percent of all cases, the five most prevalent types were "overexertion," "struck by," "fall on the same level," "caught in, under, or between," and "fall from elevation." They made up 81 percent of the costliest cases. Of all cases, the same five types prevailed, accounting for 78 percent.

The leading five types among North Carolina's most costly cases were "struck by," "fall from elevation," "caught in, under, or between," "overexertion," and "motor vehicle accidents," making up 75 percent of the cases. All of these, with the exception of "motor vehicle accidents," are in the top five of the total cases ("fall on the same level" replaces "motor vehicle accidents"). The leading five accounted for 77 percent of all cases.

Wisconsin's most costly cases showed the same five most frequent types of Arkansas's—"overexertion,"

Table 4. Distribution and rank of the costliest work-related injury cases, and of all cases, in Arkansas, North Carolina, and Wisconsin, by nature of injury, 1976[1]

[1] See table 1, footnote 1.
[2] See table 1, footnote 2.
[3] Total cases equaled 1,043 in Arkansas, 3,498 in North Carolina, and 4,660 in Wisconsin.
NOTE: Column percentages may not add to totals because of rounding.

"struck by," "fall on the same level," "fall from elevation," and "caught in, under, or between." They accounted for 71 percent of the most expensive cases. The same types, except for "fall from elevation" (which ranked seventh), were included in the top five of the State's total cases.

"Falls from elevation" tended to be among the most expensive cases in all three States and in the leading five categories for total cases in Arkansas and North Carolina as well. Also, "motor vehicle accidents" tended to be an expensive type of accident. While the category is not one of the leading categories in two States, the costs suggest that motor vehicle safety should receive some special attention from safety specialists.

Comparisons of the 10 percent most expensive cases with all cases for the categories "nature," "body part," and "source" in the three States indicated similar relationships, as shown in the following tabulation for Arkansas (details for all States are shown in tables 2, 3, and 4):

Category	*Ranking of most costly*	*Ranking of all cases*
Part of body:		
Back	1	1
Leg	2	5
Arm (including hand)	3	3
Trunk (excluding back)	4	6
Fingers	6	2
Multiple parts	5	7
Ankle, foot, or toes	7	4

Source of injury:		
Working surface	1	1
Metal item, not elsewhere classified	2	2
Boxes, containers	3	3
Vehicles	4	7
Machines	5	4
Miscellaneous	7	5
Nature of injury:		
Sprains and strains	1	1
Fracture	2	2
Hernia	3	5
Cut, laceration	4	3
Contusion, bruise	5	4

The rankings for the costliest and for all cases were similar in Wisconsin and in North Carolina. In North Carolina, 4 of 5 categories overlapped for the nature of injury. In Wisconsin, 3 of the top 5 overlapped. For "part of body," 4 of 5 overlapped in North Carolina, while the top five categories were the same in both groups of cases in Wisconsin. When the groups were examined by the source of injury, the top five categories were the same in North Carolina, and 4 of the top 5 matched in Wisconsin. Thus, while the frequency rankings varied by State, and, to some extent, by cost within States, they did not vary significantly.

Industrial distribution. The ultimate level of this analysis would be at the establishment level. However, because the Supplementary Data System does not identify cases by individual establishments, analysis was made at the intermediate level, industry.

Table 5 displays the distribution of accidents by type for the construction industry, for both the top 10 percent of its cases and its total cases. In Arkansas, "fall from elevation," "overexertion," "struck by," "caught in, under, or between," and "bodily reaction" and "motor vehicle accidents" led the subset of costly cases. Five of these were in the leading six of all cases.

In North Carolina, among the costliest cases, the top five categories were "fall from elevation," "struck by," "caught in, under, or between," "overexertion," and "contact with electric current." Four of these were in the leading five of the total. In Wisconsin, 4 of the costliest leading 5 also appeared in the leading five of the total.

Generally, data for the construction industry showed the same patterns as those for all industries: there were but a few differences in the categorical distribution of the expensive compared to the total cases.

Rankings by cost

Tables 1 through 5 show that, for each State, expensive cases were distributed among categories in about the same way as total cases. This suggests that the severity of a case (in terms of cost) in a given category is quite random. If this is true, then the proportion of cases in a given category should be similar to the proportion of costs in that category: a category with 20 percent of the cases ought to have about 20 percent of the costs. In contrast, the expensive case perspective implies that there are a few categories, with a few easily targetable cases, which make up a large proportion of the cost: for example, a category with 2 percent of the cases would account for 20 percent of the costs.

Table 6 presents the percentage of costs contrasted with the percentage of cases among accident types for each State. In Arkansas and North Carolina, the five top categories are identical in both the cost and case columns; in Wisconsin, 4 of 5 are the same. Similar results were obtained in comparing cost and case propor-

Table 6. Distribution and rank of incidence and costs of work-related injury cases, in Arkansas, North Carolina, and Wisconsin, by type of accident, 1976[1]

[2] See table 1, footnote 3.

NOTE: Column percentage may not add to totals because of rounding.

tions for the other three characteristics.[8]

The patterns are much the same as shown in earlier tables; there were few differences, with a slight variance in rankings. Generally, the distributions of cases and costs among the categories were similar, suggesting that the cost of a case in a given category is largely a matter of chance.

THERE WERE SLIGHT VARIATIONS in the leading categories, although differences did emerge among the most expensive and least expensive cases. Also, even when the leading categories were identical, their ranking in the group of expensive cases varied. And, certain categories tended to result in costlier cases: for example, the data indicate that safety specialists should give some special attention to falls from elevations and to motor vehicle accidents. However, the basic similarities of the targets selected by the two approaches were more striking than the differences. Thus, use of the expensive case and general approaches to targeting safety programs will result in about the same accident prevention priorities. □

The cost of safety incentives

The pain and suffering of a serious disability represent a substantial portion of the costs of an injury. It would be desirable for the legal system to assign liability for such losses so that the full cost of injuries is borne by the party in the best position to prevent the accident. The dilemma, however, is that if the awards routinely made in a workers' compensation system were to be so generous as to include pain and suffering there would be a strong incentive for employees to act with less than an optimal amount of care. . . .

There is some evidence that even the more generous States within the current system may fail to encourage an appropriate amount of careful employee behavior. Only a system that provides the opportunity for detailed examination of the circumstances and consequences of the injury could avoid such a distortion of incentives; but again, this would be very costly.

FOOTNOTES

[1] Daniel N. Price, *Workers' Compensation Program in the 1970's*, Social Security Bulletin, May 1979, pp. 3–24.

[2] The terms "injuries" and "accidents" also refer to "illnesses" and "exposures."

[3] Marvin W. Pearson, "The Challenge of a Changing Safety Priority," presentation at the 39th Industrial Forestry Seminar, Yale School of Forestry and Environmental Studies, May 1974.

[4] For this article, we are using costs as a shorthand measure of injury severity. The reader should be aware, however, that this approach has shortcomings. For example, a worker's compensation award for the death of a worker who has no dependents may amount to no more than funeral costs.

[5] Norman Root and David McCaffrey, "Providing more information on work injury and illness," *Monthly Labor Review*, April 1978, pp. 16–21.

[6] These categories are from the American National Standards Institute's (ANSI) *Method of Recording Basic Facts Relating to the Nature and Occurrence of Work Injuries*, ANSI Z16.2, 1962. According to the ANSI Z16.2 coding system, "nature of injury" identifies the injury by its principal physical characteristics. "Part of Body Affected" identifies the part of the person's body directly affected by the injury previously identified. "Source of Injury" identifies the object, substance, or bodily motion that directly produced or inflicted the previously identified injury. The "Accident Type" classification identifies the event that directly resulted in the injury; that is, it describes how the source of injury contacted the body.

[7] Changes in coding structures and training are used in the Supplementary Data System to reduce the number of cases classified as "not elsewhere classified" or "unidentifiable."

[8] A similar pattern was found for 1977 Arkansas data. See *Costs and Characteristics of Occupational Injuries and Illnesses in Arkansas, 1977* (Arkansas Department of Labor, August 1979).

Scheduled wage increases and escalator provisions in 1980

For the third straight year,
deferred increases will average
5.1 percent, and will be received
by 4.9 million workers;
5.5 million workers will be covered by
contracts with cost-of-living clauses

EDWARD WASILEWSKI

This year, at least 4.9 million workers in the private nonfarm sector are scheduled to receive wage increases under major collective bargaining agreements negotiated in earlier years. As in 1978 and 1979, the deferred increases will average 5.1 percent. In addition, approximately 5.5 million workers are under major agreements (covering 1,000 workers or more)[1] which have escalator clauses, many with multiple reviews in 1980.[2]

Of the 9.4 million workers in major collective bargaining units, the data exclude some 1.1 million workers whose contracts expired late in 1979 but had not been renegotiated or, if replaced, the terms were not available.[3]

Cost-of-living provisions

If the inflation rate continues to rise as it did during the first 9 months of 1979, cost-of-living escalator (COLA) reviews are likely to have a large impact on the total wage change effective in 1980. Fifty-nine percent of all workers are covered by major contracts that have clauses which provide for the periodic automatic adjustment of wage rates based on the movement of the Consumer Price Index. The number of workers having escalator clauses dropped to 5.5 million from 5.6 million a year ago.[4] The slight decline was because of employment shrinkage in some bargaining units retaining their clauses, rather than from the termination of a significant number of clauses. The following are the number of workers (in millions) under cost-of-living reviews on January 1, 1971–80:

Year	*Workers*	*Year*	*Workers*
1971	3.0	1976	6.0
1972	4.3	1977	6.0
1973	4.1	1978	5.8
1974	4.0	1979	5.6
1975	5.3	1980	5.5

While only 40 percent of all major contracts have cost-of-living clauses, escalator provisions tend to be included most often in the contracts that cover the greatest number of workers. Large blocks of workers are covered under national contracts with large companies; for example, the Auto Workers with General Motors Corporation (460,000 workers); the Steelworkers and the nine companies that comprise the Steel Industry Coordinating Committee (280,000 workers); the Teamsters and Trucking Employers, Inc. (300,000 workers); and the Communications Workers and the American Telephone and Telegraph Co. (500,000 workers). (See table 1 for the industry breakdown.)

The Auto Workers represent the largest number of workers (1,093,000) under major agreements with escalator protection. They are followed by these unions:

Edward Wasilewski is an economist in the Division of Trends in Employee Compensation, Bureau of Labor Statistics.

Table 1. Prevalence of escalator clauses in major collective bargaining agreements, November 1979

[Workers in thousands]

Industry	2-digit standard industrial classification (SIC)	All contracts		Contracts with escalator clauses		Percent of workers covered by escalator clauses
		Workers covered	Number of contracts	Workers covered	Number of contracts

Finance, insurance, and real estate	60–65	87	15	32	6	36.7
Services	70–89	296	71	13	9	4.4

NOTE: Because of rounding, sums of individual items may not equal totals, and percentages may not reflect shown ratios.

Dashes indicate absence of cost-of-living coverage.

Communications Workers (616,000), Teamsters (583,000), Steelworkers (579,000), Food and Commercial Workers (417,000) and Machinists (250,000). All other unions have fewer than 200,000 workers under major agreements with COLA provisions.

Adjustment formulas. The rate of inflation is only one of several factors that determines the amount of any increase or decrease under the provisions of an escalator clause. Another is the presence of a "ceiling," or maximum limit on an increase. Of the 5.5 million workers under cost-of-living clauses as of November 1979, 1.2 million were under contracts with such limits. An additional 635,000 were guaranteed some minimum adjustment, regardless of the movement of the CPI.[5]

As of November 1979, the most popular formula used to calculate cost-of-living adjustments was a 1-cent hourly wage change for each 0.3-point movement in the CPI—covering a total of slightly more than 2.2 million workers, up from 2.1 million as of November 1978. The next most popular formula, covering 820,000 operating and manufacturing employees in the Bell Telephone System, calls for adjustments of 50 cents a week plus 0.6 percent of each employee's weekly rate for each 1-percent movement in the CPI. About 512,000 workers have a formula that calls for a 1-cent wage change for each 0.4-point change in the CPI.

The number of workers whose escalator adjustments are based on a 1-cent wage change for each 0.3- or 0.4-percent CPI change is down to 149,000 from 370,000 last year. This drop can be attributed to recent General Electric Co. and Westinghouse Electric Corp. settlements, which provided for escalator adjustments of 1 cent an hour for each 0.2-percent movement in the CPI, instead of the previous 1 cent for each 0.3-percent movement.

The formulas become somewhat more diverse and complex when they are liberalized in steps during the course of the contract, are linked to a deferred wage increase, or have monies diverted from cash payments to offset fringe benefit costs. In the 1979 rubber industry contracts, for instance, the escalator formula changes from 1 cent for each 0.3-point change in the CPI to 1 cent for each 0.26-point change in the second contract year; in the 1979 auto industry contracts the same change takes place, but not until the third year of the contract. Some contracts in the construction industry tie the cost-of-living increase with deferred increases by giving percent-for-percent increases based on any rise in the CPI above the percent amount of any deferred increase scheduled for the year. One example of a diversion of money is in the aerospace industry, where some contracts provide that 1 cent will be withheld from each quarterly adjustment to help defray the cost of improvements in early retirement provisions. Another example is in the automobile industry, where agreements provide for the diversion of a total of 14 cents an hour from escalator adjustments to help defray the cost of the settlements. The diversion will be 1 cent from each of the first eight quarterly adjustments and 2 cents from each of the last three adjustments.

In the first 9 months of 1979, all workers receiving COLA increases under major agreements recovered an average 56 percent of the rise in consumer prices. The proportion actually recovered under individual bargaining agreements depends on the type of COLA formula, the timing of COLA reviews, and a possible "cap" on the amount of COLA increase.

Review timing and indexes. The timing of reviews has an impact on the size of individual changes under an escalator clause. As table 2 shows, approximately 50 percent of the workers covered by 1980 COLA reviews are under formulas providing quarterly reviews, 35 percent have semiannual reviews, and 13 percent annual reviews. Of course, the frequency of review in any year is also affected if the particular agreement expires during the year.

The year 1967 is the most common CPI base year for escalator formulas and is specified in contracts for over 3.7 million workers. The 1957–59 base is second most common, occurring in 87 contracts covering nearly 900,000 workers. A very small group, some 6,400 workers, still uses the 1947–49 = 100 base.

The national all-cities index continues to be the most prevalent trigger in escalator provisions: Nearly 80 percent of the clauses designate that index. One unusual clause is in the automobile industry, where a composite index is used that is derived from the official U.S. and Canadian indexes. This is done because the contracts cover workers in both countries. Specific city indexes are used in the remaining clauses.

Deferred increases

The 5.1-percent average deferred wage increase scheduled for 1980 amounts to an hourly rise of 45.0 cents. (See table 3.) Of the 4.9 million workers affected, 1.7 million will receive an average increase of 5.5 percent in 1980 as a result of 1978 negotiations. About 2.9 million workers whose new contracts were settled in the first 10 months of 1979 will receive an average increase of 5.0 percent. The average 1980 deferred increase for nearly 216,000 workers whose agreements were negotiated in 1977 is 4.2 percent. For 7,000 workers whose agreements were negotiated prior to that year, the average is also 4.2 percent.

Table 2. Timing of 1980 cost-of-living reviews in major contracts, by year of contract expiration and frequency of review

[Workers in thousands]

[1] Includes workers in the following industry groups for which separate data are not shown: Tobacco (1,000); textiles (11,000); lumber (4,000); furniture (12,000); printing (30,000); chemicals (31,000); petroleum refining (6,000); rubber (65,000); leather (30,000); stone, clay, and glass products (19,000); instruments (4,000); and miscellaneous manufacturing (16,000).

[2] Includes 164,000 workers in mining and 70,000 in finance, insurance and real estate for which separate data are not shown.

[3] Percent of straight-time average hourly earnings.

NOTE: Workers are distributed according to the average adjustment for all workers in each bargaining unit considered. Deferred wage increases include guaranteed minimum adjustments under cost-of-living escalator clauses. The number of workers affected in each industry is based on data available in early November 1979 and, thus, may understate the number of workers receiving deferred wage increases. Only bargaining units in the private, nonagricultural economy covering 1,000 workers or more are considered in this table. Because of rounding, sums of individual items may not equal totals. Dashes indicate there are no workers having wage increases that fall within that stated range.

Approximately 213,000 workers will receive a deferred increase in 1980 before their contracts expire later in the year. Nearly 260,000 workers, whose contracts were negotiated prior to 1980 have neither a deferred wage increase nor a cost-of-living review scheduled for 1980. Another 34,000 with post-1980 expirations will have an escalator review but no deferred increase in 1980.

As table 3 shows, out of a total 2.2 million workers receiving deferred wage increases in 1980 in the manufacturing sector, the largest single block of workers (1.3 million) is in the metalworking industries. The average gain in these industries—3.2 percent—is smaller than in 1979. In the nonmanufacturing sector, over 800,000 construction industry workers will receive an average gain of 6.9 percent, about the same as in 1979.[6] The nonmanufacturing sector as a whole continues to have a higher average deferred increase than the manufacturing industries. This is true whether the increase is considered in percentage or cents per hour terms: nonmanufacturing averages 5.6 percent and 54.9 cents, and manufacturing averages 4.5 percent and 32.7 cents. A possible explanation is that escalator clauses are more prevalent in manufacturing industries (70 percent of workers) than in nonmanufacturing industries (50 percent).

Workers in the paper industry will have the largest percent deferred wage gains of any group, an average of 8.0 percent. Construction workers will receive the largest hourly raise, 80.0 cents. Workers in the transportation industries, a group that accounts for a substantial portion of all those receiving deferred increases in 1980, will receive an average 4.3 percent or 43.7 cents. Workers in transportation equipment manufacturing will receive an average wage-rate increase of about 3 percent.

Table 4 shows when in 1980 workers will receive deferred wage increases. The heavy concentration of increases in July largely reflects changes scheduled for 432,000 workers in the railroad industry, and the September concentration is primarily made up of increases scheduled for 650,000 Auto Workers at General Motors Corp. and Ford Motor Co.

For contracts covering 5,000 workers or more, the 1980 average increase in the cost of both deferred wages and benefits is 5.4 percent. (See table 5.) This is an increase from the 1979 average of 4.7 percent and the 1978 average of 5.3 percent.

An important influence on the negotiation of deferred increases implemented over the term of a contract is the possibility of any additional wage gains under escalator provisions. The likelihood of wage changes based on the inflation rate tends to hold down the amount of the guaranteed deferred increases. This tendency is evident in 1980, as in previous years, in an average 6.8 percent deferred wage rate increase for contracts without a cost-of-living clause versus only a 3.8 percent gain in contracts with such provisions.

Table 4. Workers receiving deferred increases in 1980 in bargaining units covering 1,000 workers or more, by month

[Workers in thousands]

Effective month	Principal industries affected	Workers covered
Total[1]		4,865
January	Construction; transportation	380
February	Food stores	117
March	Mining; cans; Chrysler	456
April	Construction; rubber; trucking	696
May	Construction	468
June	Construction; apparel; General Electric	828
July	Construction; Westinghouse; railroads	948
August	....	176
September	Meatpacking; General Motors and Ford	864
October	Farm equipment	135
November	....	86
December	....	62

[1] This total is smaller than the sum of individual items because 350,000 workers will receive more then one increase. This total is based on data available as of Nov. 1, 1979 and, thus, may understate the number of workers receiving deferred increases for the entire year.

Table 5. Workers receiving deferred wage and benefit increases in 1980 in bargaining units covering 5,000 workers or more, by size of increase

[Workers in thousands]

Percentage increase	Workers covered
All settlements providing deferred changes[1]	3,124
Under 3 percent	82
3 and under 4	451
4 and under 5	1,225
5 and under 6	355
6 and under 7	383
7 and under 8	254
8 and under 9	249
9 and under 10	76
10 and under 11	42
11 percent and over	6
Mean increase (percent)	5.4
Median increase (percent)	4.6

[1] This total excludes workers covered by contracts expiring in 1980 who receive a deferred benefit change only.

NOTE: Only bargaining units in the private, nonagricultural economy are considered in this table. Because of rounding, sums of individual items may not equal totals.

The total of 4.9 million workers scheduled for deferred wage increases in 1980 is fairly close to the number of workers who received such increases in 1979, but substantially lower than the number who received deferred increases in 1978.[7] This difference in coverage is attributable to the cyclical nature of collective bargaining negotiations. Eighty percent of the workers in major bargaining units are under 3-year contracts; therefore, a pattern has emerged in which two years of heavy bargaining are followed by a third year with substantially fewer expirations and wage reopenings. In the pattern's lighter bargaining years, such as 1978 and 1981, a maximum number of deferred wage changes is put into effect. ☐

——*FOOTNOTES*——

[1] They include multiplant or multifirm agreements covering 1,000 workers or more, even though individual units may be smaller. About 1 in 10 members of the civilian labor force is covered by a major bargaining agreement.

[2] For an analysis of the bargaining schedule for 1980, see Mary A. Andrews and Winston Tillery, "Heavy bargaining again in 1980," *Monthly Labor Review*, December 1979, pp. 20–28.

[3] Information was not available for 60 agreements that expired between November 1, 1979, and December 31, 1979, covering 221,000 workers; 243 agreements that expired earlier in the year but for which negotiations were continuing or terms of the new agreement were not yet available, covering 892,000 workers; and 12 agreements with no specified expiration date, covering 42,000 workers.

[4] The 5.5 million workers in major contracts include those under expired contracts containing such clauses, in which new agreements had not been negotiated at the time this article was prepared. This discussion excludes workers whose contracts provide for possible reopeners based on increases in the Consumer Price Index. Virtually all of these workers are represented by the Ladies Garment Workers Union.

[5] The guaranteed minimum portion of a cost-of-living increase is treated as a scheduled wage increase and is included in the tabulations for deferred increases in 1980. Some 431,000 workers are covered by clauses that have both minimum and maximum limits.

[6] About 304,000 of these are construction workers who will receive deferred increases under settlements in which the parties agreed to a total wage and benefit package, with the ultimate allocation between wages and benefits to be determined by the union. Because the final division was not known at the time this article was prepared, the entire amount has been treated as a wage increase and may be expected to change as the data become available.

[7] For an analysis of the 1979 data, see Beth A. Levin, "Scheduled wage increases and escalator provisions in 1979," *Monthly Labor Review*, January 1979, pp. 20–25.

Labor and the Supreme Court: significant decisions of 1978–79

The Court approved voluntary efforts to eliminate the effects of discrimination, rejected NLRB attempts at balancing conflicting interests in the workplace, and amplified public employers' constitutional rights to set hiring policies and work restrictions

GREGORY J. MOUNTS

Significant labor cases decided by the Supreme Court during its 1978–79 term were highlighted by discrimination issues, but the broad range of the remaining topics prevented the emergence of a dominant theme or direction. Some decisions forged new statutory interpretations that protected existing policies threatened by new claims of individual or institutional rights.[1] At other times, the Court elevated individual rights to block existing policies.[2] Another important group of cases further reduced constitutional restrictions on the employment practices of governments.[3]

In the year's most celebrated case, the Court endorsed the right of employers and unions to jointly eliminate a work force's racial imbalance through voluntary affirmative action programs.[4] The Court's permissive interpretation of Title VII of the 1964 Civil Rights Act in this case was a marked change from the more restrictive readings of the law it has made in recent years.[5] The Court also expanded individuals' rights to file discrimination suits under both the 1964 law and the Constitution,[6] but it found that, where it applied, Title VII was the sole remedy for proven acts of job discrimination.[7]

The Court rejected the position of the National Labor Relations Board in three of four cases involving traditional labor law issues—a considerable shift from the clean sweep the Board achieved a year earlier. In a pair of cases, the Court ruled that the Board had given too much weight to the interests of unions in soliciting new members among hospital employees and in obtaining information from an employer.[8] The interests of hospital patients for a quiet environment and those of workers for the privacy of psychological test information place limits on union activities, the Court concluded. The Court also restricted the Board's claimed jurisdiction over religious schools,[9] but it agreed that in-plant food prices and food services are mandatory subjects of bargaining.[10]

Public employment cases decided by the Court last term suggest that there are few constitutional restrictions on the hiring decisions of public employers. Excluding aliens from public teaching positions,[11] barring persons involved in methadone programs from transit system jobs,[12] and preferring veterans over all other job applicants (despite the acknowledged disparate impact upon women)[13] are all permissible public employment practices, the Court ruled. Another ruling extended public employers' constitutional authority to impose mandatory retirement on certain groups of workers.[14] The Constitution was held to protect workers whenever and wherever they voice their views to their employer;[15] but the Court also made clear that workers have no constitutional right to compel their employers to respond to their remarks or even listen to what they have to say.[16]

In other cases, the Court ruled that the status of cer-

Gregory J. Mounts, an economist on the staff of the *Monthly Labor Review*, writes "Significant Decisions in Labor Cases."

tain pension benefits prevented any significant enforcement of workers' pre-1974 rights to benefits;[17] that future Federal pension benefits cannot be divided under State community property laws;[18] and that the Social Security Act cannot constitutionally deny benefits to unemployed mothers when it permits benefits for unemployed fathers,[19] but can constitutionally deny benefits to the mother of a wage earner's illegitimate children, providing those benefits only to the worker's spouse or former spouses who care for their children.[20]

Employment discrimination

Discrimination cases decided by the Supreme Court in recent years, including the 1978 *Bakke* decision,[21] offered no clue as to how the Court would rule on the issue of voluntary affirmative action programs in employment. The Court's approval of such plans under Title VII of the 1964 Civil Rights Act rejected the argument of 'reverse' discrimination and should identify *Weber*[22] as perhaps the single most important interpretation of the job bias law for a long time to come.

The Court specifically ruled in *Weber* that Congress did not intend to forbid all private, race-conscious affirmative action programs; the law does not *require* preferential treatment of minorities, but neither does it prohibit such treatment. Thus, the Court concluded that private parties could voluntarily agree to correct racial imbalances resulting from "traditionally segregated job categories." This holding rested on the recognition that a racially imbalanced workforce can be the result of general societal discrimination, and it allows employers to correct such imbalances without incurring any liability for discriminatory practices that may have dictated their hiring decisions. One important aspect of this approach is that it permits the correction of racial imbalances created before 1964 and, therefore, outside the possible reach of the law's prohibitions. Another result is that a guilty employer need not admit guilt to correct the effects of past violations.

There were several significant qualifications laid out by the Court concerning what kind of voluntary affirmative action programs are permissible. Specifically, the Court required that such preferential plans be temporary, that incumbent employees not be displaced, and that the advancement of white employees not be "unduly impeded." However, the Court's only comment about the contours of these criteria was that the plan in *Weber* fell within them. Thus, questions about how long a plan may operate, when it "unduly" impedes the advancement of whites, and which "traditionally segregated job categories" it may address will likely be the subjects of future court challenges. Some preliminary answers may be found within the framework of court-imposed preference schemes; Equal Employment Opportunity Commission guidelines may also provide some answers to these difficult questions.

Untouched by *Weber* is the separate issue of whether courts may impose racial quotas or goals to remedy proven violations of Federal civil rights laws. *Los Angeles v. Davis*,[23] decided just prior to *Weber*, involved this issue, but the Court found that the underlying question of alleged discrimination had become moot. Because the imposed quotas had eliminated the discriminatory effect of earlier hiring practices and because those practices were unlikely to be repeated, the Court refused to consider whether the judicial imposition of quotas was permissible under these or any other circumstances. Interestingly, two pairs of dissenting justices who would have ruled on the merits of the case indicated that the lower court had probably gone too far in imposing the quotas; it is unlikely that the five-justice majority would have been unanimous on the same issue.

In another Title VII case last term, the Court issued a brief *per curiam* opinion on the nature of an employer's burden in rebutting a *prima facie* case of discrimination. Earlier Supreme Court cases specified that an employer must "prove an absence of discriminatory intent" in such circumstances.[24] However, in the same cases, the Court also identified the requirement as the need to "articulate some legitimate nondiscriminatory reason" for the apparent violation. *Sweeney* pointedly required only the latter, possibly less demanding, standard to be used in such cases.

In its 1978 *Furnco* decision,[25] the Court indicated for the first time that an employer could use statistics on the racial composition of its work force to help defend an alleged discriminatory hiring practice. *Sweeney*'s clarification of an employer's burden in such a defense may therefore be a necessary element in a Court formula allowing employers greater leeway in hiring decisions.

In three separate cases, the Court considered important questions about how individuals may seek in Federal courts to redress alleged acts of discrimination. *Novotny*[26] established that Title VII provides the sole statutory protection against employment discrimination for all private workers, extending an earlier ruling that had the same result for Federal workers.[27] The Court rejected a claim that an alleged victim of job bias could seek relief under the Civil Rights Act of 1871, reasoning that to allow such a bypass of Title VII would defeat the important administrative framework for resolving such claims established by that law.

In two other cases, however, the Court broadened the opportunities for individuals to bring discrimination suits in Federal courts. In *Cannon*,[28] the Court interpreted Title IX of the 1964 Civil Rights Act to provide a private right of action for alleged acts of sex discrimination by educational institutions that receive Federal funds. In *Passman*,[29] the Court found similar private rights to redress alleged acts of job discrimination under the Constitution. Although Congress exempted its members when it outlawed discrimination in employment, the Court extended the reasoning of earlier cases[30] and found that congressional employees may sue their employers directly under the due process clause of the Fifth Amendment. In cases like *Passman,* where the defendant is no longer a member of Congress, the Court also ruled that money damages would be an appropriate remedy instead of reinstatement. However, the question of whether the constitutional protection of congressmen's "speech and debate" shields them from such liability remains to be sorted out by the lower court. The Court's ruling in *Passman* would also seem to apply to all Federal judicial branch employees, who are similarly unprotected by Title VII.

Traditional labor law

Of the four Supreme Court cases involving the National Labor Relations Board during the 1978–79 term, the Court rejected the Board's position in three. Two of these three involved the Board's policymaking and remedial authority under the National Labor Relations Act to balance competing interests in the workplace. In both, the Court substituted its judgment for that of the specialized labor agency. In the third, the Court denied the Board jurisdiction over church-operated schools, based on a new interpretation of the act.

In *Detroit Edison,*[31] the Court ruled, contrary to the Board's view, that the privacy rights of employees who were denied promotion consideration based on psychological tests outweighed the interests of their union in obtaining the test materials for use in a grievance against the employer. Although the relevance of the test information to the union's needs was not an issue in the case,[32] the fact that other competing interests may outweigh those of a union in such cases was a signficant modification of the High Court's earlier rulings in this area.[33] The Court suggested that the employer's willingness to supply the test materials only with the consent of the employees satisfied its statutory obligations under the NLRA. The fact that employers may now cite their employees' substantial and overriding interests in not releasing some information may result in more tests of unions' informational rights under Section 8(a)(5) of the act.

The Board's basic prescription for balancing the organizing interests of unions with the interests of employers and patients in medical care institutions was seriously questioned by the Court in *Baptist Hospital.*[34] The decision reaffirmed a 1978 case invalidating a hospital's no-solicitation rule in first floor eating or concession areas not frequented by patients.[35] However, the Court refused to endorse the Board's view that such rules were also invalid when applied to hospital corridors above the first floor and in sitting rooms adjacent to patient rooms as well. The Board had wanted to limit no-solicitation rules to "immediate patient care areas," which it defined as treatment and operating rooms and patient rooms. But the Court made clear that the narrowness of the Board's interpretation was completely unsatisfactory for the special circumstances of health care environments.

The Court has generally taken a limited role in reviewing Board policies. But in *Baptist Hospital,* the Court cited the inadequacy of the Board's policy formulation in this area—and essentially required the Board to perform a more sophisticated factual analysis of the potential effects of its decisions. The questions that the Board must confront in this area are complex, and, as suggested by the Court, may not lend themselves to line drawing. Rather, each case may have to be examined on its specific merits, using a more analytical framework.

In *Catholic Bishop of Chicago,*[36] the Court interpreted the NLRA as not covering lay teachers in parochial schools. The act is silent on the issue, but the Court refused to permit representational activity in church-operated schools, stating that it would invariably raise First Amendment questions on the separation of church and state. The decision replaces the Board's previous standard for claiming jurisdiction in this area. In the past, it had asserted jurisdiction over schools that were "merely religiously associated"—those offering some secular subjects. Now, however, the Board is barred from claiming jurisdiction over all "church-operated" schools. As was the case in *Catholic Bishop,* church-operated schools may offer both religious and secular subjects.

Ford Motor Co.[37] was the single case last term in which the Court agreed—unanimously—with the Board's position. The Board has long held that in-plant food prices and services are mandatory subjects of bargaining, but Federal appeals courts had never enforced such a Board bargaining order until recently. The High Court expanded the 7th Circuit's approval of the specific facts of this case into a general rule applicable to all employers with existing food services, noting that the Board was authorized to define the "terms and conditions of employment" subject to mandatory bargaining under the act.

Some aspects of the Court's opinion appear to require employers with existing food services to consider major changes at the bargaining table. For example, the Court compared food services with other employee benefits contracted for by the employer, where the terms of such services can be altered through subsidies. In addition, an employer may also be required to change suppliers as a means of exercising "leverage" over food prices and services.

A union's duty to fairly represent the grievances of its members is based on judicial interpretation of the national labor laws. When workers have won suits against their unions for violations of this implied responsibility, some lower courts have allowed punitive damages—in excess of the amount of injury sustained—when the union or its officers acted in a particularly inappropriate manner.[38] Last term, however, the Supreme Court ruled in *IBEW v. Foust*[39] that under no circumstances could a union be held liable for such excess damages in fair-representation cases.

The Court recognized that a union's decisions in handling grievances often involve judgments that reflect its collective responsibility. The threat of substantial monetary penalties under such circumstances, the Court concluded, could "disrupt responsible decisionmaking essential to peaceful labor relations." Although *Foust* was based on implied rights under the Railway Labor Act, the Court made clear that its ruling should extend to the NLRA. However, some question remains as to whether it goes even further.

Punitive damages have been imposed under the Landrum-Griffin Act when a union violated its statutory obligations to its members. The law specifically provides "such relief as may be appropriate" for violations of those rights. Although the majority in *Foust* wrote that its decision involved only judicially created remedies for judicially implied rights, four justices who concurred in the result felt that the Court's rationale concerning the financial threat to unions could also act to bar punitive damages under Landrum-Griffin.

Although it is well established that Federal labor laws prevail over State laws where they conflict, it has been less clear what State regulations are permissible in areas left unregulated by Federal law. Last term, the Court found that the National Labor Relations Act did not preempt a New York law providing unemployment benefits to strikers.[40] The NLRA is silent on the issue, and the result appeared to conflict with a pair of earlier rulings barring State actions not specifically preempted by the act because they would have altered the economic balance of power between labor and management.[41] The Court acknowledged that this balance was disturbed by the New York law, but a majority ruled that the legislative history of the NLRA in conjunction with the nearly concurrent history of the Social Security Act left the States free to shape their own unemployment compensation statutes.

John Paul Stevens, who was joined by only two other justices, wrote the main opinion for the split majority, offering a potential cutting edge for deciding similar preemption cases. He suggested that where a State law (as in this case) was designed to assist all workers in the State rather than to interfere in labor disputes, it should be preempted only if Congress clearly intended to forbid the challenged activity. The limited support for this approach among other members of the Court means that these kinds of preemption issues will continue to be decided on a case-by-case basis.

Public employment

Several Supreme Court decisions broadened the constitutional authority of public employers to deny jobs to certain groups, while permitting them to prefer other groups of jobseekers for public employment.

Ambach[42] marked the second time in 2 years that the Court has broadened the scope of permissible State restrictions on the employment of aliens. In 1978, *Foley*[43] upheld a citizenship requirement for State police officers because of their important governmental responsibilities. This decision paved the way for a similar requirement for public schoolteachers a year later, when the Court upheld a New York law barring aliens who have not applied for citizenship. *Ambach* permitted States to limit alien participation "when exercising the functions of government," a somewhat broader area than the "important nonelective . . . officers" covered by *Foley*. In both cases, the Court ruled that State laws imposing such qualifications on public employment must be "rationally related" to some legitimate interest to pass the constitutional test —a less restrictive measure than the "strict scrutiny" standard that had long been used to test classifications based on alienage. Also in its 1978–79 term, the Court let stand a Federal appeals court ruling that upheld the constitutionality of Executive Order 11935 barring aliens from Federal civil service positions.[44]

Another restriction on public employment held constitutional by the Court last term was the exclusion of persons involved in methadone programs from jobs with a city transit authority.[45] The excluded workers claimed that the line drawn by the transit authority grouped a disproportionately high percentage of minority workers and violated Title VII as well as the Constitution. Based on statistical evidence, however, the Court found no Title VII violation; it also ruled that the Fourteenth Amendment's equal protection clause does not prevent a public employer from drawing such a line to exclude persons from employment for the legitimate interests of safety and efficiency in operating public transportation. However, the Rehabilitation Act of 1973 (enacted after this case began) may prohibit such discrimination in federally funded programs.

A third public employment practice held constitutional by the Court last term was a State's authority to grant absolute hiring preference to veterans. In *Feeney*,[46] the Court recognized that such laws have a tremendous disparate effect on women, but upheld the classification in Massachusetts because the State's lawmakers had not granted veterans preference for the *purpose* of discriminating against women. This standard for measuring whether a governmental classification is discriminatory under the Constitution was first established in the Court's 1976 *Washington v. Davis* decision.[47] But in that case, a test that had a discriminatory effect was approved partly because it was found predictive of subsequent success in a job training program. Thus, the tool of discrimination in *Davis* was upheld on two grounds: it did not purposefully discriminate and it was job related.

In this respect, *Feeney* appears to expand the dimensions of *Davis* by permitting States to establish selection criteria—veteran status—not related to job performance, as long as any disparate effect on an identifiable group of workers was not a purposeful act. But some have suggested that the Court's treatment of veterans recognizes their important contribution to the Nation's well being, and that certain exceptions involving their status may not be easily adapted in other cases.

In a pair of cases decided during its 1978–79 term, the Court also added to the wide range of restrictions that public employers may constitutionally impose upon their employees.[48] In 1976, the Court found no equal protection violation in a State law requiring mandatory retirement at age 50 for uniformed State police.[49] Such a restriction was found to be rationally related to the State's legitimate interest in maintaining the physical condition of its police. Last term, the Court used essentially the same rationale in upholding a Federal law requiring mandatory retirement of Foreign Service Officers at age 60.[50] The age restriction was rationally related to the Government's legitimate interest of maintaining the "professional competence" of this important group of public servants, the Court ruled.

In *Martin*,[51] the Court also found no equal protection violation for a school board to enforce a continuing education requirement for its employees by not renewing their contracts. Before the legislature made annual salary increases mandatory, the board had denied raises to noncomplying teachers. The greater penalty of contract nonrenewal, the Court ruled, was rationally related to the board's legitimate objective of enforcing the education requirement.

The theme that appears to unite most of last term's public employment decisions is the substantial constitutional freedom the Court has approved for public employers to make hiring decisions and impose restrictions based on legitimate objectives. This freedom should, perhaps, be viewed as balanced by the expression of the electorate in the political process. Organized groups of citizens can often exercise some influence over the employment decisions of public agencies.

First Amendment issues

Even though Court decisions involving public employment in 1979 appeared to emphasize employers' broad freedoms under the Constitution, the Court also extended Constitutional protections afforded public employees. In *Givhan*,[52] the Court ruled that the First Amendment protects a public employee from discharge or other discipline for expressing critical remarks in a private conversation with a superior. Earlier rulings in *Pickering* and *Mt. Healthy*[53] recognized this free speech protection for public employees' comments to the public about their employers. In extending this rationale to private conversations, the Court also imposed its *Mt. Healthy* test for a worker's reinstatement: a discharged employee must be reinstated if the employer fails to show that the worker would have been terminated "but for" the protected speech.

Thus, the Court has found that the Constitution guarantees workers the right individually or collectively to voice their views to their employer; but the Court also made clear in a pair of cases last term that the First Amendment does not afford workers the right to compel either public or private employers to engage in a dialogue or even listen to their comments.

In *Babbitt*,[54] Arizona's agricultural labor relations statute was challenged for allegedly curtailing workers' First Amendment freedom of association by requiring representation elections not coincident with seasonal employment peaks and by restricting those employees eligible to vote. The Court ruled, however, that Arizona was under no constitutional obligation to provide a law that required employers to negotiate with worker representatives. Its enactment of such a law with a poorly written provision for representation elections does not raise any constitutional problems, the Court concluded. Several other provisions of the law were also challenged on constitutional grounds. On those, the Court ruled that provisions limiting consumer publicity and imposing criminal penalties must first be interpreted by State courts before any constitutional claims could be considered; provisions concerning union access to workers on farms and the arbitration of disputes also should not be ruled on, the Court said, because of insufficient experience in their operation.

In *Smith*,[55] the Court resolved a conflict between circuit courts of appeals by ruling that the First Amendment's neutral effect on private employers' responsibility to listen to their employees applies to public employers as well. The First Amendment is not a substitute for a labor relations statute, the Court reasoned; it does not impose any affirmative obligation on the government to respond to its employees' legally elected bargaining agent. The Court indicated that the same action by a private employer might constitute an unfair labor practice. But for public employers not under statutory constraints as well as for private employers not covered by Federal labor laws, as in *Babbitt*, representational efforts by unions may only be successful based on voluntary recognition.

Pensions and other benefits

Two pension questions were resolved by the Court during 1978–79. In *Daniel,*[56] the Court refused to include compulsory, noncontributory pensions as investments under the securities laws. A worker made ineligible for benefits under such a plan because of a break in employer contributions had sought relief under the antifraud provisions of the securities statutes. He had hoped to charge the union with fraud for not making known that any break in contributions invalidated his benefits. Although the Employee Retirement Income Security Act of 1974 offers greater protection of workers' pension benefits, it provides no coverage to those who retired prior to 1974, as in *Daniel.*

The Court's ruling, however, was limited to those plans where the employer alone makes contributions. The Court may be more likely to consider plans where employees have made some monetary contribution as a form of investment under the securities laws.

In a case involving Federal pension benefits, the Court ruled that expected payments to the retired worker cannot be divided based on State community property laws. *Hisquierdo* [57] reversed a California Supreme Court ruling splitting the expected benefits of a retired railroad employee with his former spouse. The High Court interpreted the language of the Railroad Retirement Act to require that benefits be distributed only to the retired worker and that no benefits be "anticipated." This latter provision was apparently meant to protect beneficiaries from creditors, but was constructed in broad enough terms to apply to all those—including a spouse—who may seek to claim a worker's earned benefits.

Benefits available under the Social Security Act were the subject of a pair of decisions by the Court during 1978–79. In *Califano v. Westcott,*[58] the Court ruled that a program providing benefits to unemployed fathers with dependent children but not to unemployed mothers violated the Fifth Amendment's due process clause. Instead of cutting off all benefits to the unemployed fathers of some 300,000 children, the Court chose to require that unemployed mothers receive payments for their dependent children. In *Califano v. Boles,*[59] the Court ruled that a program providing mothers' insurance benefits was not unconstitutional for denying benefits to mothers of illegitimate children which had been earned by their fathers. The Court found that restricting a worker's benefits to legal dependents defined by a marriage contract was rationally related to the legitimate interests of the state. Any impact on illegitimate children as a class, the Court said, was speculative and incidental to the operation of the law.

In another case involving the Social Security Act, the Court limited the ability of individuals to file suits in Federal court challenging provisions of the law. In *Chapman,*[60] the Court ruled that Federal court jurisdiction under Sec. 1983 of the 1871 Civil Rights Act is limited to rights secured by the Constitution or by Federal laws providing for equal rights or civil rights. Because the jurisdictional statute creates no substantive rights itself and because the Social Security Act does not provide the rights specified, claims that State welfare regulations conflict with the Federal law cannot be brought in Federal courts under the 1871 law.

Other Federal laws

The Supreme Court resolved an important procedural question of the Age Discrimination in Employment Act last term which had created a conflict among the circuit courts of appeals. In *Oscar Mayer v. Evans,*[61] the Court ruled that alleged victims of discrimination under the act must first resort to State administrative agencies, where available, before filing a claim at the Federal level. Such Federal claims can only be filed after 60 days following the commencement of State proceedings, the Court ruled. The Court also resolved the issue—for the sake of expediency—of what rights a claimant has if State jurisdictional requirements (such as a time limit) cannot be met. In such a case, the Court ruled, an individual's Federal rights remain intact, but the individual must first make the potentially futile act of filing a State claim.

In its first interpretation of some of the requirements of the Rehabilitation Act of 1973, the Court ruled that the law does not require institutions receiving Federal funds to accept as a student (nor presumably as an employee) a person whose handicap prevents him or her from meeting the requirements of a particular program (occupation).[62] Such an institution is also not required to provide "extensive modifications" that would make the student's (worker's) participation physically possible. The Court's ruling was an extremely narrow interpretation of the law's requirement that "no otherwise qualified handicapped individual" can be excluded "solely by reason of his handicap" from participation in any program receiving Federal funds. The Court appeared to focus on the financial and administrative burdens of institutions in meeting the needs of handicapped persons. Thus, in situations where such burdens are less significant, institutions may be required to make greater accommodations.

Another case of great significance for both business and labor in 1979 involved a challenge to the President's authority to deny Government contracts to companies that do not comply with voluntary wage and price guidelines. The Supreme Court refused to review a Federal appeals court ruling that Presidential authority for such action rested in the Federal Property and Administrative Services Act of 1949.[63] The act authorizes the

President to secure "economy" and "efficiency" in Federal procurement, and the court reasoned that this language, coupled with the intent of Congress in enacting the law, permitted the President to maintain a restrictive procurement policy that could hold down current and future costs. The appeals court also noted that no one has a right to a Government contract and that those wishing to do business with the Government must do so on its terms. This reasoning would also appear to support the Government's practice of denying contracts to those companies not in compliance with Federal requirements barring employment discrimination.

In 1979, a question involving the political influence and employee leave policies of public employers arose under the Voting Rights Act of 1965. A county school board in Alabama required employees who also were candidates for political office to take unpaid leave of absence regardless of whether they campaigned during work hours. In *White,*[64] the first black in many years to run for State office from the county challenged the board's leave policy.

Extending the reasoning of earlier cases,[65] the Court found that the board qualified as a political subdivision under the act because it had the power to impose disabling qualifications on citizens' right to vote for the candidate of their choice. Based on this classification, the Court ruled that the board's leave policy was a "standard, practice, or procedure with respect to voting" subject to preclearance by the Department of Justice for any discriminatory impact. The Court may have broadened its definition of a political subdivision in order to fulfill the congressional purpose of eliminating the possibilities for subtle forms of voting discrimination in areas with a history of restrictive practices. □

State labor legislation enacted in 1979

During a heavy legislative year, States banned most types of employment discrimination, eased child labor and mandatory retirement requirements, called for flexible work hours, and provided for other improvements in working conditions

RICHARD R. NELSON

In 1979, a large volume of State labor legislation was enacted, involving minimum wage rates, flexible work hours, child labor restrictions, mandatory retirement requirements, and employee privacy.[1]

The subject of minimum wage once again received much attention. Rates were increased by legislation or wage order in nine jurisdictions this year—Arkansas, District of Columbia, Minnesota, New Jersey, New Mexico, North Carolina, North Dakota, Oregon and Rhode Island—and in 15 States and Guam by prior law, wage order, or administrative action. Sixteen jurisdictions now have a minimum rate for some or all occupations equal to or greater than the $2.90-an-hour Federal standard. In addition, provision was made in the laws of 23 jurisdictions for an automatic rate increase in 1980, though not necessarily to the Federal $3.10 rate. In more than half of the jurisdictions, the minimum wage established for tipped employees was at least equal to that payable under the Fair Labor Standards Act.

In North Carolina, the minimum wage, maximum hours, child labor, and wage payment laws were consolidated into a single wage and hour act. Among its provisions were an increase in the minimum wage rate, a requirement for payment of overtime after 45 hours (previously 50 hours), and extension of minimum wage coverage to public employees. Coverage of the minimum wage law also was extended in other States, including to school district employees in Arkansas and to all public employees in Maine.

Prevailing wage legislation came under attack in several States. While most attempts to repeal or weaken existing laws failed, the law in Florida was repealed and the Alabama law will be repealed at the close of the 1980 session, unless it is continued by legislative action. In Colorado, State highway construction is no longer subject to the law, and dollar thresholds governing coverage were increased in Connecticut, New Mexico, and Wyoming.

Wage garnishment or assignment was another area of legislative interest, with laws enacted in 11 States. Most of the laws involved either the amount of earnings that may be garnished, or court-ordered assignment of wages for delinquent child support payments. As a result of the January 1 increase in the Federal minimum wage rate, the amount of employee earnings protected from wage garnishment automatically increased under both State and Federal law which link the limit on garnishment to the Fair Labor Standards Act.

Resolutions in Alaska and California and laws in Colorado and Illinois called for the establishment of flexible working hours or flexible positions in State government. Under another California law, State employees in agencies that plan to reduce personnel by at

Richard R. Nelson is a labor standards adviser in the Division of State Employment Standards, Employment Standards Administration, U.S. Department of Labor.

least 1 percent or more now may voluntarily reduce their worktime (and corresponding compensation) to preserve jobs through a redistribution of work.

Child labor legislation continued the trend towards easing employment restrictions. Most common this year were provisions permitting employment in places where alcoholic beverages are sold, as long as the jobs do not directly involve serving drinks. Restrictions concerning night work and maximum hours were eliminated for 16- and 17-year-old minors in North Carolina and Virginia. In Maryland, the labor commissioner was authorized to grant individual exceptions to the hours and nightwork restrictions of minors under age 16, if such exceptions do not endanger their health and welfare or interfere with their schooling.

Compulsory retirement based solely upon age, a subject examined in recent years at both the Federal and State level was addressed by legislation in 23 jurisdictions. Mandatory retirement of most State employees was eliminated in Iowa and Tennessee; it was extended to include private employment in Maine; and was abolished for both private and public sector employees in New Hampshire. Several other States raised the mandatory retirement age from 65 to 70 for various categories of workers—most frequently public employees. In some instances, employees are permitted to continue working beyond the established mandatory retirement age with periodic employer approval and upon submission of proof of fitness.

A majority of the States enacted legislation addressing one or more forms of employment discrimination. Most notable were new comprehensive human rights laws in North Dakota prohibiting employment discrimination by both public and private sector employers and in South Carolina, replacing a law formerly applicable to public sector employees only. In Nebraska, the State was prohibited from discriminating on the basis of religion, sex, disability, marital status, or national origin, as well as race and color as before. Other laws prohibited employment discrimination on the basis of a physical or mental handicap and some established affirmative action programs and policies to eliminate sex and age discrimination. Refusal to reinstate a worker disabled on the job to his or her former position or other suitable employment was made an unlawful emloyment practice in Oregon, and in Iowa, a proposed equal rights amendment to the State constitution was adopted, subject to approval in the November 1980 general election.

Help for displaced homemakers continued to attract considerable legislative attention. During 1979, an additional eight States—Arkansas, Nevada, New Hampshire, New Jersey, North Carolina, North Dakota, South Dakota and Washington—passed laws to provide for employment services and other aids to help homemakers displaced because of dissolution of marriage or other loss of family income. In addition, Maryland continued its displaced homemaker program and in Oregon, coverage was extended to include certain persons on public assistance or underemployed. Indiana established opportunities industrialization centers to provide job training and other services for all economically disadvantaged, unemployed, and underemployed persons.

"Right-to-work" measures were proposed but defeated in 13 jurisdictions. Ten of the measures were attempts to enact legislation where none currently exists and three were attempts to supplement existing statutes with a constitutional amendment.

Among other labor standards areas receiving attention in 1979, a law prohibiting the employment or referral of illegal aliens was enacted in Louisiana, and prohibitions on the use of lie detector or stress evaluation tests as conditions of employment were enacted for the first time or amended in five jurisdictions. Additional laws restricted employers' access to employees' criminal records, guaranteed employees the right to review their personnel files, protected employees against retaliation because of required jury service, and regulated the transportation and handling of nuclear and other hazardous wastes. A new provision in Maine required employers to furnish employees with information on the identities and hazards of chemicals in the workplace.

No additional States ratified the proposed Equal Rights Amendment to the U.S. Constitution. Approval by three additional States is necessary by June 30, 1982, for adoption. Resolutions in Arizona and Utah opposed the 3-year time extension granted in 1978.

The following is a summary by jurisdiction of labor legislation during 1979.

Alabama

Wages. The prevailing wage law automatically will be repealed at the end of the 1980 legislative session unless continued by the legislature.

Other laws. The director of the State department of public safety may collect "reasonable" fees from employers for searching criminal records of employees or applicants for employment in a nuclear powered electric-generating facility licensed by the U.S. Nuclear Regulatory Commission.

Alaska

Wages. By prior law (which sets the minimum wage at 50 cents above the Federal rate), the State rate rose to $3.40 an hour in 1979 and will increase each year, reaching $3.85 on January 1, 1981.

Hours. A concurrent resolution requested the Governor to pursue a policy of granting State employees the option of flexible working hours if such hours show promise of providing better and more efficient service.

Occupational safety and health. The labor department is directed to perform elevator inspections in accordance with the

American National Standards Institute Inspector's Manual, establish inspection fees, and maintain records of inspections and fees collected.

Arizona

Wages. The section of the prevailing wage act establishing the method for rate determination (use of collectively-bargained rates) was declared unconstitutional by the State court of appeals as an unlawful delegation of legislative power to private persons over whom the legislature has no supervision. Earlier in the year, the Governor had vetoed a bill to repeal the law.

Equal employment opportunity. A concurrent resolution requested the attorney general to institute legal action challenging the legality of the extension of the deadline for ratification of the Equal Rights Amendment.

Other laws. Elected or appointed officials were prohibited from using their political influence or position to cause the firing, promotion, or demotion of any public employee or the hiring of or failure to hire an applicant for public employment.

Arkansas

Wages. The minimum wage rate will rise from $2.30 an hour to $2.55 on January 1, 1980, and to $2.70 on January 1, 1981. Tip allowances will increase to $1.25 an hour on January 1, 1980, and to $1.35 on January 1, 1981. Coverage of the minimum wage law was extended to employees of public schools and school districts.

Court-ordered assignment of wages for delinquent child support payments was authorized.

Equal employment opportunity. Age discrimination in State and local public employment against persons at least 40 years of age but under 70 is now prohibited, with certain exceptions. Employees over age 70 may continue in employment with annual written authorization from their employers.

The State policy of providing public employment for visually or otherwise handicapped persons, who are able to perform the job, on the same terms as nonhandicapped persons was amended to specifically include persons with hearing impairments.

Labor relations. A new law to assure the impartiality and integrity of the State mediation and conciliation service required that all information and materials prepared or received be held confidential and prohibited disclosure without prior written consent of both parties to the dispute.

By amendment to the teacher fair dismissal law, teachers now are protected against "arbitrary, capricious, and discriminatory" firings and may inspect their personnel files and comment on any material included in them. Formerly, teachers had only the right to know the reason for their firing and to have a hearing before the school board. Procedures now include the board's decision and appeal to the circuit court, if desired. Also, a distinction was made between the rights of probationary and nonprobationary teachers.

Occupational safety and health. A State Fire Prevention Commission was created with responsibilities including the development and maintenance of a Statewide fire prevention program and the coordination of activities with other State and Federal agencies involved in fire prevention.

Displaced homemakers. A displaced homemakers act required the local services department to establish a pilot multipurpose service center to develop job counseling, training, placement, and other services for homemakers displaced by dissolution of marriage, death of spouse, or other loss of family income. Whenever possible, staff positions will be filled by displaced homemakers.

Other laws. The legislature provided for the continuation of a number of boards, commissions, and agencies, including the labor department, formerly scheduled to terminate on June 30, 1979, under a sunset law.

California

Wages. A previous wage order provided for an increase in the minimum wage rate from $2.65 an hour to $2.90 on January 1, 1979.

A minimum wage provision, due to expire on January 1, 1980, set a subminimum weekly salary for student employees in organized camps at 85 percent of the minimum rate for a 40-hour week, regardless of the weekly hours worked.

Appeals of an order, decision, or award of the labor commissioner relating to wage recovery previously heard by the Superior Court, now may be heard by a municipal court as well.

Employers who pay wages in cash must keep adequate written records of all deductions and give a statement listing the deductions to each employee semimonthly or at the time of payment. An employer's records must be kept for 3 years and be available for inspection by the employee upon reasonable request. Employers in violation now are subject to civil penalties.

Hours. State employees in agencies planning a reduction in personnel of 1 percent or more may voluntarily reduce their worktime, with a corresponding reduction in compensation, so that employment opportunities can be preserved through redistribution of work.

A Senate resolution urged the Governor to consider the establishment of a 40-hour, 4-day workweek for State employees.

A law was reenacted authorizing the chief of the Division of Labor Standards Enforcement to exempt employers or employees from any mandatory days-off requirement if the chief determines a hardship will result. This exemption will expire January 1, 1981.

Agriculture. The Employee Housing Act, which includes the regulation of labor camps, was removed from the labor code and added, in amended form, to the health and safety code.

Operators of labor camps, including camps on dairy farms consisting only of permanent housing, now may request exemptions from the requirement of obtaining an annual permit to operate. The operators may not terminate or modify a tenancy agreement or intimidate, threaten, restrain, coerce, blacklist, or discharge employees or tenants because they exercise their rights in connection with employee housing.

Equal employment opportunity. Changes were made in the fair employment practices law to permit mandatory retirement of tenured professors after age 65 prior to July 1, 1982, and age 70 thereafter, and to permit mandatory retirement of employees in executive or high policymaking positions at age 65.

Physical handicap, medical condition, sex, and age were added to the list of discriminatory practices disputes which the Fair Employment Practices Division is authorized to assist communities in resolving. Previously, this help was limited to disputes involving race, religious creed, color, national origin, marital status, or ancestry.

Employers may not require employees or job applicants to obtain copies of their criminal record or supply any notification that such a record exists.

Labor relations. State managerial and confidential employees and employees of the Maritime Academy are expressly excluded from coverage under the State Employer-Employee Relations Act, and managerial and confidential employees now are prohibited from holding elective office in an employee organization.

Contracts between the State and the regional developmental disabilities centers, which provide services for the developmentally disabled, may not prohibit the center's employees from forming a labor organization, bargaining collectively, or engaging in other activities for mutual aid or protection.

Private employment agencies. Required employment agency surety bonds were increased from $1,000 to $3,000.

Occupational safety and health. The health and safety code was amended to codify changes made by the Governor's Reorganization Plan Number 1 of 1978, including abolishing the Division of Industrial Safety and creating a Division of Occupational Safety and Health within the Department of Industrial Relations.

Inspection warrants may be issued if employers refuse to permit places of employment to be inspected, and an order may be issued to preserve physical materials or the accident site as it was at the time of an accident.

Employers who successfully appeal occupational safety and health violation citations to the Occupational Safety and Health Appeals Board are permitted to seek costs, up to $5,000, where such citations were arbitrary or capricious.

Public employees must report the spill or otherwise accidental release of pesticides to the local health department.

Other laws. A worksite education and training program was established to provide funding to integrate classroom instruction with entry level and career training for youth and the economically disadvantaged.

Employees may no longer be required to assign rights to an invention to their employers if no equipment, supplies, facilities, or trade secret information of the employer was used and if the invention was developed on the employee's own time, does not relate to the employer's business or actual or anticipated research, or does not result from any work performed by the employee for the employer.

Colorado

Wages. Statutory provisions requiring the payment of prevailing wage rates on State highway construction were repealed.

Public works payment bond requirements for contractors were amended by enacting a $10,000 contract threshold amount where none existed before, and by replacing references to "cities and towns" with "municipalities."

The proportion of wages exempt from garnishment was changed from 70 percent for the head of a family or 35 percent for a single person, to conform with the Federal law limiting garnishment to either 25 percent of disposable weekly earnings or earnings exceeding 30 times the Federal minimum hourly wage, whichever is less.

Hours. County employers were given greater flexibility in scheduling their work force, by permitting them to establish workweek formulas providing for work in excess of 40 hours during consecutive 7-day calendar periods by averaging work hours over a longer period of time.

Child labor. Private vocational schools were added to and proprietary schools removed from the list of institutions authorized to provide student-learner programs and administer tests to determine minors' ability to perform the work for which they seek an exemption from the child labor laws.

Equal employment opportunity. The mandatory retirement age was raised to 70 years, from 65, for State employees but employees may continue to apply annually for a continuance in employment beyond the retirement age.

The termination date for the Civil Rights Commission and the Civil Rights Division, scheduled for July 1, 1979, under sunset legislation, was extended to July 1, 1985.

Other laws. Retaliation against State employees who disclose evidence of mismanagement and abuse within State government was prohibited.

Connecticut

Wages. By prior law, the hourly minimum wage increased to $2.91 on January 1, 1979, with further increases on January 1 of each year—to $3.12 in 1980 and $3.37 in 1981.

Public sector coverage under the minimum wage law was clarified by redefining "employer" to include the State and its political subdivisions. The law also was amended to permit agricultural employers of fewer than 8 workers during the preceding calendar year to pay workers under age 18 a subminimum rate of 70 percent of the basic minimum. For minors employed by other agricultural employers, the subminimum rate continues at 85 percent of the adult rate.

The prevailing wage threshold amount was increased from $5,000 to $50,000 for new construction and from $5,000 to $10,000 for remodeling, alteration, or repair.

Equal employment opportunity. The State Fair Employment Practices Act was amended to permit involuntary retirement at age 65 for executives and policymakers employed in such positions for 2 years before attaining age 65 and who are entitled to an immediate annual retirement income of at least $27,000. The act also was amended to prohibit discrimination because of present or past history of mental disorder.

A pregnant employee who gives written notice of her pregnancy to her employer may be transferred temporarily to a new position if either the employer or employee believes that injury could result from continued work in her regular job.

A pilot program will be established to recruit, support, and train women for skilled industrial jobs where labor shortages exist.

The Commission on Human Rights and Opportunities replaces the Department of Administrative Services as the agency that adopts regulations to assure affirmative action for equal employment opportunity in State agencies, and the program to promote employment of the handicapped was transferred from the commissioner of human resources to the labor commissioner.

Labor relations. The law governing teacher and administrator contract disputes was amended, replacing advisory arbitration with final and binding arbitration based on the last best offer of either party, with each disputed issue being resolved separately.

For a 3-year period, State contracts are not to be awarded to persons or firms found in violation of the National Labor

Relations Act on at least three occasions during the past 5 years.

If the State Labor Relations Board has not determined whether a prohibited practice is being committed by a municipal employer or employee organization within 30 days after the filing of a complaint alleging the violation, the Board may order the questioned activity stopped until the issue is decided.

Local or regional boards of education may enter into agreements with exclusive bargaining representatives to require that, as a condition of employment, teachers pay the representative an annual fee through payroll deduction to help defray the cost of collective bargaining, contract administration, and grievance adjustment.

Occupational safety and health. Responsibility for safety regulations on installation of oil burners was transferred from the labor commissioner to the commissioner of public safety.

Other laws. The labor department, in cooperation with municipalities, public and private agencies, and business and industry, will develop and implement work-training programs for the chronically unemployed. Any employable person receiving support from any town may be required to participate, and will receive compensation for the time spent in training.

Employers now are required to permit employees to inspect their personnel records and to allow inspection of medical records by a physician chosen or approved by the employee. Records may not be disclosed without the employee's consent, except by subpoena.

Employers in the machine tool and metal trades who conduct apprenticeship training programs will receive a tax credit for each apprentice hired above the average number hired in the past 5 years.

State departments are to purchase, for their own use, supplies and services produced or made available by State correctional industries.

Delaware

Equal employment opportunity. The upper limit for protection from age discrimination in private or public sector employment was raised from 65 to 70 years. The lower limit remains at age 40.

In addition to matters regarding race, color, creed, national origin, or ancestry, the State Human Relations Commission now may act as conciliator in matters regarding discrimination based on sex, physical handicap, age, or marital status.

Occupational safety and health. A Hazardous Materials Transportation Act of 1979 was adopted to regulate the transportation of hazardous materials in the State. A commission was created to administer and enforce the act, and to study the necessity of additional legislation.

Other laws. The law prohibiting employer use of lie detector tests as a condition of employment or continuation of employment was expanded to ban use of voice stress analyzers.

District of Columbia

Wages. A revised wage order became effective August 5, 1979, for manufacturing, wholesale trade, and printing and publishing occupations. Among other changes, the revision increased the minimum wage from $2.46 to $3.50 an hour and eliminated a differential for young workers, except full-time students who must be paid a rate equal to the Federal minimum wage rate and persons hired under the Youth Employment Act and the Comprehensive Employment and Training Act who must be paid at least $2.65 and $2.90 an hour, respectively.

Two 90-day emergency laws were enacted (the first expired August 21, 1979, and the second, November 20, 1979) to provide summer and other employment opportunities for youth.

Other laws. A law enacted late in 1978 prohibits the administration of lie detector tests to current or prospective employees. Violators may be subject to both criminal and civil penalties.

Florida

Wages. The State prevailing wage law was repealed.

Agriculture. The migrant labor program was transferred from the Department of Community Affairs to the Executive Office of the Governor.

A Farmworker Housing Assistance Act was enacted to provide for financial and technical assistance to public bodies and nonprofit groups who will provide for the sponsorship of farmworker housing in areas of the State where a clear need exists.

Labor relations. Changes were made in the procedures for filing and processing unfair labor practice complaints, and provision was made for the circuit courts to enforce the orders of the Public Employees Relations Commission.

An Office of Labor Relations was established in the State government with duties including representing the Governor in collective bargaining negotiations.

The position of part-time alternate member of the Public Employees Relations Commission was abolished and a provision that the three full-time members serve at the Governor's pleasure was removed. Public employee organizations are still required to register with the Commission prior to requesting recognition by a public employer for purposes of collective bargaining, but now must also register prior to requesting certification as an exclusive bargaining agent.

Occupational safety and health. A "loss prevention program" was established requiring each State department, except the legislature, to have a safety coordinator trained by the insurance department in all areas of safety. Previously, each department had a coordinator that dealt with fire safety only. The coordinators, along with representatives from the Divisions of State Fire Marshall and Risk Management, will make up the Interagency Advisory Council on Loss Prevention.

Other laws. The criteria for apprentice occupations were revised, and include a requirement that the occupation must involve manual, mechanical, or technical skills and knowledge which require a minimum of 2,000 hours of on-the-job training.

All State agencies, in the purchase of goods and services during the next 2 years, are to require that the bidders' wage and price behavior is in compliance with standards established by the President's Council on Wage and Price Stability.

The State Manpower Planning Act was renamed the State Employment and Training Act and its administration was transferred from the Department of Community Affairs to the labor department.

An employer may not threaten an employee with dismissal because of the nature or length of time served on jury duty. Previously, only actual dismissal was prohibited.

Georgia

Equal employment opportunity. The definition of age discrimination in the merit system and personnel law relating to State employees was amended to include only those between 40 and 70 years of age. Previously, no limits were included. In 1978, the fair employment practices law prohibited age discrimination against public employees between age 40 and 65.

A House resolution continued the study committee on services for the aged which was established to examine the needs of the elderly and the adequacy of existing programs. The committee is to report its findings and recommendations to the General Assembly by January 1, 1980.

Guam

Wages. The minimum wage rose to $2.90 an hour and will continue to increase each year to match Federal rates under a prior law which adopted the Fair Labor Standards Act rates by reference.

Equal employment opportunity. The prohibition on employment discrimination based on age will be limited to persons who are at least age 40. Previously, no age was specified.

Other laws. Summer youth employment programs were established involving both the public and private sectors. Funds were provided to the labor department's Senior Community Service Employment Division to provide meaningful employment to needy senior citizens.

Hawaii

Wages. By prior law, the minimum wage rate was raised from $2.65 to $2.90 an hour effective July 1, 1979, with future increases to $3.10 on July 1, 1980, and $3.35 on July 1, 1981.

Court-ordered wage assignments were authorized for delinquent child support payments, and employers are prohibited from disciplining employees whose wages are subject to this assignment.

A concurrent resolution urges Congress to review the average annual wage limitation for the State's public service employment participants under the Comprehensive Employment and Training Act, and to exempt such participants from the mandated average wage provisions.

Equal employment opportunity. It is now an unlawful employment practice for an employer to deny reemployment or other rights to an employee who returns from National Guard duty.

A Senate resolution encouraged employers to consider epileptics for employment.

Other laws. Several resolutions aimed at improving the employment situation in Hawaii were adopted. The U.S. Secretary of Labor was petitioned to raise the average annual wage limitation for the State's public service employment participants, to waive the time limitations on participation in CETA programs, and to release available discretionary funds for the continued full implementation of the CETA programs in Hawaii. The Commission on Manpower and Full Employment was requested to study the feasibility of the State creating part-time jobs for the elderly at the minimum wage or better, and the State Occupational Information Coordinating Committee was urged to utilize an advisory committee structure to permit increased participation of those interested in the development of a comprehensive occupational information system.

Idaho

Wages. Public bodies that require contractors to provide payment or performance bonds exceeding 50 percent of the total contract may not withhold more than 5 percent of the amount payable, pending acceptance of the project.

The civil service law was amended to exempt holidays from being considered as hours worked for overtime computation.

School attendance. A requirement that each county auditor publish an annual summary of the compulsory school attendance provisions was repealed.

Illinois

Wages. Students employed by the college or university they are attending and who are covered under the Federal Fair Labor Standards Act are now exempt from coverage under the State minimum wage law.

The labor department may assist in the collection of all wages due, instead of the previous limitation of $1,000 per employee. Permissible wage deductions were restricted to those required by law, for the employee's benefit, with the employee's freely given written consent, or for valid wage assignments or orders. Employers must pay terminated employees their earned vacation.

Benefits and refunds payable by pension or retirement funds, employee assets held by such funds, and required employee payments to such funds are no longer subject to garnishment.

Hours. The provision authorizing flexible hours positions in State employment was amended to define such positions as including part-time jobs of 20 hours or more a week, a job shared by two employees, or a job involving normal weekly hours but performed in fewer days than ordinarily required. Goals for the number of flexible hours positions are to be established in every department or agency and procedures were established for reevaluation when the goals are met.

Child labor. Hearings upon complaint of a violation or to revoke any certificate are to be conducted in accordance with the Administrative Procedure Act, after which the department may issue cease and desist orders, revoke certificates, and determine civil penalties.

Minors under age 16 may work where liquor is served as "busboys" and in the kitchen of private clubs or fraternal or veterans organizations. Also, they may work in skating rinks owned and operated by a school or unit of local government.

Agriculture. The requirement that farm labor contractors deposit a surety bond with the labor department as a condition of certification was made optional. A provision was continued permitting persons aggrieved by the misconduct of any certified farm labor contractor to sue for equitable relief.

Equal employment opportunity. Fair Employment Practices Act affirmative action requirements now specifically empower hearing officers to order reinstatement, hiring, backpay (for up to 2 years prior to filing of the complaint), costs, and reasonable attorney fees. A provision was also added permitting the award of attorney fees to the respondent if the complaint is found to be frivolous or unreasonable.

Labor relations. In cases of teacher reduction, dismissal must begin with those having the least continuous service with the school district, unless an alternative plan is established by collective bargaining. Affirmative action programs are exempt from this provision.

Private employment agencies. The labor department may prescribe information required in contracts between agencies and job applicants. Agency license applicants need no longer be U.S. citizens but must furnish proof of good moral character and business integrity and that they have never been party to a fraud, have no jail record, and do not belong to subversive organizations.

Employer-paid agencies are no longer restricted with respect to contacting prospective and existing job applicants (except those they have already placed) and do not have to identify themselves as agencies in advertisements, but must state that they are acting as a representative of an employer.

Occupational safety and health. The Department of Public Health was authorized to inspect and investigate the personnel of radiation installations, as well as the premises and operations as before, to study and evaluate past, current, and potential health hazards. Monthly inspection reports will be made to the U.S. Nuclear Regulatory Commission and will be available to the public.

Employers are now required to provide information concerning prevention of injury or disease by contact with poisonous materials or fumes to any employee whose work involves entering an underground sewer and to have safety information and equipment available at the work site. Violation is a business offense punishable by a fine of up to $5,000.

Other laws. After receiving reasonable notice of an employee's summons to jury duty, an employer must give the employee time off to serve. Also, it is unlawful for an employer to discharge or retaliate in any way against an employee who is absent from work to appear in court as a witness in a criminal proceeding pursuant to a subpoena. In neither case is the employer required to pay wages for the period of such absence.

The Commission on Labor Laws was continued to study labor and employment laws and decisions and their enforcement.

The Board of Vocational Rehabilitation was abolished and a Department of Rehabilitation Services was created with essentially the same powers and duties and an 11-member Rehabilitation Services Advisory Council was established to advise the director of the department.

Indiana

Wages. Employers required to make garnishment deductions from employee's wages are entitled to $8, or 2 percent of the total amount deducted, whichever is greater, to be paid equally by the creditor and the debtor.

Equal employment opportunity. The State age discrimination in employment act is no longer applicable to those covered by the Federal law, and the upper limit for State protection was raised from age 65 to 70. The mandatory retirement age for teachers was raised from age 66 to 71, with provision for work beyond that age with a doctor's certificate proving physical and mental ability.

The State Civil Rights Commission and local civil rights agencies were authorized to refer complaints to each other for further action.

Occupational safety and health. Numerous changes were made in the mining safety law, including extending safety requirements formerly applicable to gassy coal mines to all underground coal mines, establishing new ventilation and electrical equipment standards, providing for the certification of assistant mine foremen, and specifying new escape procedures.

Other laws. Opportunities industrialization centers were established to provide comprehensive job training and related services for economically disadvantaged, unemployed, and underemployed individuals.

The Office of Manpower Development became the Office of Occupational Development, and the Manpower Development Council became the Employment and Training Council.

Iowa

Equal employment opportunity. Mandatory retirement of State employees was eliminated; other public sector employees may work beyond age 70 with employer approval, except for police officers and firefighters, who must retire at age 65. State conservation officers age 21 to 65 may now be appointed; formerly the age limits were 22 to 31.

A proposed equal rights amendment to the State constitution was adopted, subject to approval in the November 1980 general election.

Kansas

Wages. Individuals employed by a unified school district are exempted from the minimum wage and overtime law if they spend more than one-half of their working hours in an executive, administrative, or professional capacity.

Overtime pay for public or private emergency medical service personnel will be based on hours after 258 in 28 days (the same as for police and firefighters), instead of after 46 hours a week. Also, hours worked by police and firefighters voluntarily substituting for one another on regular tours of duty are not to be counted in computing overtime pay.

A three-debt limit on protection from discharge because of wage garnishment was removed. Court-ordered support may now be enforced by garnishment.

Labor relations. When professional negotiations between a school board and professional employees' organization are at an impasse, the parties may jointly notify the Secretary of Human Resources so that impasse resolution procedures can begin. Previously, a district court was required to find that an impasse existed before resolution procedures could commence.

Kentucky

Wages. By prior law, the minimum wage rate was raised from $2 to $2.15 an hour on July 1, 1979.

Louisiana

Wages. A resolution requested that student workers at Louisiana State University be paid the Federal minimum wage or that the present student wage rate be increased by the same percentage as the Federal rate.

Equal employment opportunity. A resolution requested a study of employment discrimination in the State.

Labor relations. A concurrent resolution requested the establishment of a joint legislative committee to study public sector employer-employee relations, including collective bargaining and strikes.

Occupational safety and health. Plants and other industrial facilities which manufacture, store, or maintain toxic substances must prepare emergency plans for notifying proper public safety authorities in case of accident. Violators may be fined up to $25,000.

Undocumented workers. Knowingly employing or referring illegal aliens for employment was prohibited in all industries, except agriculture. A first violation (regardless of the number of aliens employed) carries a fine of up to $100; a second violation is punishable by a fine of up to $150 for each employed alien; and subsequent violations are punishable by fines of from $500 to $2,000 for each alien.

Other laws. The labor department, scheduled to terminate on July 1, 1980 under the State's sunset law, was continued to July 1, 1984.

A person serving as an official, officer, or employee of the State will be insured against financial loss arising from claims, demands, suits, or judgments for actions performed in the discharge of duties, provided damages did not result from a willful act or gross negligence, and he or she is entitled to be represented in any action by the attorney general.

An Office of Elderly Affairs and an Aging Advisory Board were established in the Governor's office each with powers and duties to promote the welfare of the elderly.

Maine

Wages. The minimum wage was increased to $2.90 an hour on January 1, 1979, under a prior law which mandated matching State increases to the Federal rate, up to a maximum $3 rate. A 1979 law increased the maximum limit for matching the Federal rate to $4 an hour.

Minimum wage coverage was extended to employees of the State, counties, municipalities, and school administrative units. These employees were exempted from overtime pay requirements.

Railroad corporations in the State are required to furnish all operating personnel working on trains individual wage statements with each payment, listing accrued total earnings and taxes to date and a separate listing of daily wages and how they were computed. Violation may result in a penalty of up to $100 for each offense.

Child labor. Children under age 14 are prohibited from working in agricultural employment involving direct contact with hazardous machinery or hazardous substances. Such work now comes within the limitations on hours and days of work as that for minors under age 16, and now requires work permits and recordkeeping. Other work in agriculture remains exempt.

School attendance. A child who has attained age 15 or has completed the ninth grade will be exempted from school attendance otherwise required to age 17, if he or she has permission from the parent or guardian and from local school officials, and has agreed, in writing, to meet at least annually with such persons until reaching age 17, to review the possibility of returning to day or evening school.

Equal employment opportunity. Beginning January 1, 1980, the prohibition against mandatory retirement at any age or upon completion of specified years of service (formerly, applying only to public employment) will be extended to private employment.

Sex discrimination under the State Human Rights Act was redefined to include pregnancy and medical conditions resulting from pregnancy.

A polygraph examiners law was enacted to regulate that business and to prohibit employers (except law enforcement agencies) from requiring a polygraph test as a condition of employment or of continued employment.

Labor relations. Unions engaged in collective bargaining with an employer may negotiate on behalf of retired and disabled former employees regarding pensions and retirement benefits.

Retaliation against an employee who has sought the assistance of or has cooperated with the State board of arbitration and conciliation is prohibited.

The law requiring employers to provide terminated employees with a written statement of the reason for termination was amended to provide for a 15-day time limit and a penalty of from $50 to $500 for violation.

Mediation services by members of the Public Employees Labor Relations Board, offered to parties free of charge, were limited to 3 days per case. The costs for factfinding will be added to other costs shared equally by the parties to the dispute.

Either party to negotiations involving State employees may publicize the written initial collective bargaining proposals 10 days after both parties have made their initial proposal.

The provisions of the municipal collective bargaining law limiting the period during which questions concerning representation can be raised will not apply to matters of unit clarification.

Occupational safety and health. An employee who believes he or she was discharged or discriminated against for reporting a safety violation may file a discrimination complaint with the labor director, who may bring civil action. Relief may include rehiring or reinstatement to the former position with backpay. Previously, discrimination was prohibited, but no course of action was specified.

A new provision requires employers to furnish employees with information on the identities and hazards of chemicals in the workplace through means such as education and training programs and substance data sheets.

The State fire marshal or fire inspectors may prohibit the use of any building not conforming to the laws, ordinances, or rules and regulations of the commissioner of public safety. Previously, such prohibition had to be based upon specific building conditions listed in the statute.

Other laws. Entries in personnel records of State, county, and municipal employees, including medical records, confidential personal references, credit and personal history, and references to performance evaluations or disciplinary action were guaranteed confidentiality by excluding these items from the definition of "public records." Also, a new law clarifies what personal information pertaining to school employees is to be open to public inspection and requires that employees be permitted to review their personnel files.

Employers must include in personnel files any nonprivileged medical records they have relating to employees. Failure to allow employees to review their personnel files could result in a fine against the employer.

Maryland

Wages. The minimum wage rose to $2.90 an hour and will continue to increase each year to match the Federal rate under a prior State law which adopted the FLSA rates by reference.

The amount of tips an employer may credit against the minimum wage was decreased from 50 to 45 percent with a further reduction to 40 percent scheduled for January 1, 1980.

Employers may not use tip credits unless the employee is informed and retains all tips received.

The State equal pay law was amended to remove the exclusion of employers covered by the Federal Equal Pay Act of 1963.

Child labor. Upon written parental permission, the labor commissioner may grant exceptions to the hours and nightwork restrictions for minors under age 16, if there will be no hazard to the health and welfare of the minor and it will not create any problems with fulfilling school requirements for graduation.

Equal employment opportunity. In consultation with the secretary of personnel, the director of aging is to establish a 3-year demonstration employment program for persons age 70 and over to determine the feasibility of finding employment for them in State agencies. A final report is to be submitted to the legislature in January 1982.

A joint resolution was approved urging an end to job and other discrimination against fat people and requesting that the State Commission on Human Relations study such discrimination and report to the General Assembly by January 1, 1980, with proposals to alleviate such discrimination.

Labor Relations. Employers are prohibited from discharging employees because of their participation in civil defense, civil air patrol, or volunteer rescue squads and fire department activities in response to emergencies declared by the Governor at the request of a local government.

Occupational safety and health. The labor commissioner is now authorized to order a review of hearings held under the occupational safety and health law. Previously, a review was required only upon appeal of an interested party.

Displaced homemakers. The displaced-homemaker program was extended from a pilot project to a permanent program. Additional centers, or extension of the programs of the current center to other areas of the State, are authorized if funds become available.

Massachusetts

Wages. The minimum wage rose to $2.90 an hour on January 1, 1979, and will increase to $3.10 on January 1, 1980, and $3.35 on January 1, 1981, under the provisions of a 1977 amendment.

Child labor. The minimum age for obtaining a license to sell alcoholic beverages or for purchasing such beverages was increased from 18 to 20. Persons 18 or over still may be employed to handle and sell alcoholic beverages, and minors under 18 may still be employed provided they do not directly handle, sell, mix, or serve alcoholic beverages.

Equal employment opportunity. Credit unions may not elect directors who have attained age 72, but directors 72 years and older currently holding office may be reelected.

Labor relations. All petitions alleging an impasse in negotiations involving municipal police and firefighter collective bargaining must be reviewed by the joint labor-management committee in the labor department before being accepted by the Board of Arbitration and Conciliation. The committee also may exercise jurisdiction over disputes and is empowered to conduct formal or informal conferences and take other steps, including mediation, to encourage resolution of the dispute.

Employers who fail to make payments to an employee health or welfare or pension or other such plan as required by the terms of an agreement, within 60 days after they become due, will be guilty of a misdemeanor and fined from $100 to $500 for each offense.

Binding "last-best-offer" arbitration procedures were established to help resolve impasses in collective bargaining negotiations between public employers and employee organizations representing uniformed State police or metropolitan district commission police below the rank of captain. These procedures expire June 13, 1982.

Successor clauses in collective bargaining agreements are to be binding and enforceable against successor employers for up to 3 years from the effective date of the agreement between the contracting employer and labor organization. Exempted are public employers, employers subject to either the National Labor Relations Act or the Railway Labor Act, and receivers or trustees in bankruptcy.

Other laws. Provisions were continued to July 1, 1981, allowing the labor commissioner to suspend the operation of certain labor laws, including those limiting or prohibiting the employment of minors over age 16, in case of industry emergency or hardship.

Michigan

Wages. By an amendment adopted in 1977, the minimum wage increased to $2.90 on January 1, 1979, with future increases to $3.10 on January 1, 1980, and $3.35 on January 1, 1981. These increases equal those under Federal law.

Additional employees now are subject to State overtime pay requirements, and optional methods of computing overtime pay were made available for police officers, firefighters, security personnel in correctional institutions, and resident employees of public hospitals.

Equal employment opportunity. Under the State Civil Rights Act, employers, employment agencies, and unions may not require employees or job applicants to take a polygraph examination, lie detector test, psychological stress evaluation, or similar tests. An earlier separate law forbidding employers to require employees to submit to polygraph and lie detector tests was retained.

The availability of a polygraph test may be announced if employees are informed that it is not a condition of employment. An employee's statement directly related to a job qualification or a violation of State law may be investigated through other means.

The recovery of attorney fees and lost benefits or privileges was added to backpay and reinstatement as possible remedies for public employees whose political activity protections are violated.

Other laws. The labor department will annually submit to the Governor a 5-year full employment plan, including projected levels of employment and unemployment, and recommendations for increasing job opportunities and effectiveness of training. The Governor will submit the plan to the legislature which must alter or reject the plan or it will be automatically implemented.

Upon request, the labor department in cooperation with the commerce department, will establish a program to assist in developing employee-owned corporations when an establishment is closing or transferring operations, resulting in a loss of jobs.

Minnesota

Wages. Minimum hourly wage rates were increased from $2.30 an hour effective January 1, 1980, with further increases to $3.10 on January 1, 1981, and $3.35 on January 1, 1982. Differential minimums for workers under age 18 also were raised.

Child labor. Authority of the labor commissioner to issue orders compelling compliance with the child labor laws was broadened to allow him to apply for restraining orders.

Equal employment opportunity. The effective date of a prohibition on mandatory retirement before age 70, for most private and public sector employees, was changed from June 1, 1980, to April 24, 1979. The later date will remain for employers of fewer than 20 employees.

Before scheduling a hearing on an alleged unfair discriminatory practice, the commissioner of human rights must determine that attempts to eliminate the unfair practice by conciliation have been or would be unsuccessful.

Vietnam-era veterans (those serving the Armed Forces between July 1, 1964 and December 31, 1976) will be included in the affirmative action program of the State civil service system until 1989.

Private employment agencies. Management consultants and management search firms were exempted from the employment agency regulatory law.

Other laws. The director of the division of voluntary apprenticeships will establish a plan for equal employment opportunity in apprenticeships, and now may grant reciprocal approval to properly registered, multistate apprenticeship programs in all industries except the construction industry, if such programs are in accordance with Federal regulations. Requirements for completion of apprenticeships were reduced from 4,000 hours or 2 years of reasonably continuous employment, to 2,000 hours or 1 year of employment.

Certain personnel data relating to public employees now are considered public information, including salary, benefits, job description, education and training, previous work experience, and disciplinary action.

Mississippi

Occupational safety and health. The State Board of Health may refuse to issue or may suspend, revoke or amend licenses to use or handle sources of radiation if the licensee or applicant has been refused a license, or has had one suspended, revoked, or restricted in another jurisdiction.

Other laws. The boards of supervisors of Hancock, Harrison, and Stone Counties, and their municipalities were authorized to enter into a mutual agreement to provide employment and training services.

Missouri

Private employment agencies. Agencies may no longer accept deposits on placement fees, and now are subject to class action suits for damages caused by their acts.

Other laws. The law was repealed which required that all factories and manufacturing establishments submit to the labor department an annual statistical report on employment, wages, and other specified information.

Montana

Wages. Premium overtime pay after 40 hours a week is no longer required by law in certain occupations. Among those exempted are taxicab drivers, employees subject to the maximum hours provisions set by the U.S. Secretary of Transportation, foster parents, and employees of small forestry and lumbering operations.

Public employees separated from service may be paid on the next regular payday, or 15 days from the date of separation, instead of within 3 days as required for private sector employees. If they are discharged for cause, all unpaid wages become due and payable immediately.

Hours. The provisions establishing a maximum 8-hour day for bus drivers or attendants and a minimum 12-hour rest between work shifts were amended to exempt employees of a city, town, county, or political subdivision.

Child labor. A joint legislative resolution requested that a committee study the State child labor laws in relation to the present work environment and Federal child labor laws, and report its findings and recommendations on proposed modernizing legislation to the next session of the legislature.

Equal employment opportunity. A new law permitted court enforcement of the labor commissioner's decision on maternity leave complaints.

Labor relations. Binding "last-best-offer" arbitration was provided for in firefighter disputes if an impasse occurs and mediation and factfinding have failed. Strikes are prohibited.

The public employee collective bargaining law was amended to exempt confidential employees from coverage and to restrict union representation of Board of Personnel Appeals employees to organizations which do not represent any other employees.

Private employment agencies. Musical booking agencies were exempted from the employment agency regulatory law.

Occupational safety and health. Inspection of passenger elevators and escalators in public places by maintenance and insurance company representatives certified by the Department of Administration may now be permitted, in lieu of inspection by State inspectors.

Other laws. The required period of on-the-job work experience for apprentices was reduced from 4,000 to 2,000 hours, and provision was made for granting apprentices full or partial credit for prior training or experience in the trade, on the recommendation of the employer or the joint apprenticeship committee and with the approval of the labor department.

Nebraska

Wages. Any teacher or administrator employed by a school district may authorize, in writing, deductions from wages for payments to a professional or labor organization.

Equal employment opportunity. The upper limit for protection from employment discrimination based on age was raised from 65 to 70 years (the lower limit remains at age 40), as was the mandatory retirement age of State employees. An administrative advisory committee for older Nebraskans was established to prepare a comprehensive Statewide plan for services to the aging.

The State, its governmental agencies and political subdivisions are now prohibited from employment discrimination on the basis of religion, sex, disability, marital status, or national origin, as well as race and color as before, and such agencies may now be sued under the Fair Employment Practices Act.

An affirmative action program was implemented and an affirmative action office established to insure equal opportunity in State employment.

Labor relations. The Court of Industrial Relations was renamed the Commission of Industrial Relations and was given new powers, including authority to order bargaining begun or resumed for all public employees including teachers, rather than only public utility employees, and to require mediation and factfinding. The commission was authorized, in cases of violations, to make findings and enter orders as necessary to provide adequate remedies and resolve the dispute.

Occupational safety and health. Public power and irrigation districts now must comply with State safety and health regulations.

Other laws. Discharging or penalizing an employee for serving on jury duty is prohibited and will be considered a misdemeanor.

Nevada

Wages. The minimum wage rate increased to $2.75 an hour on January 1, 1979.

A work-hour limit on public works contracts of 8 hours daily and 56 weekly, except in emergencies, was repealed.

Child labor. The prohibition of employment of minors in public dance halls was restricted to those in which alcoholic beverages are dispensed, and the limited definition of public dance halls as those where women or girls are employed or attend for profit was removed.

Labor relations. Employee organizations, recognized by a local government employer, will now be required to file an annual report with the Employee-Management Relations Board. The report will include information on the organization's constitution, officers, membership, and any collective bargaining agreements in effect.

Private employment agencies. Maximum applicant-paid placement fees were increased from 40 percent to 55 percent of the first month's wages.

Occupational safety and health. The State inspector of mines now will conduct as well as develop mine safety education programs and training and is authorized to accept funds from private and public sources for administration of the mine safety law. Mine operators are to notify the inspector of mines prior to the opening and closing of mines.

A joint resolution urged Congress to enact legislation to return to the States the right to regulate or participate in the regulation of safety and health in mines.

Displaced homemakers. A displaced homemakers act directed the State Board for Vocational Education to establish a center to provide services for displaced homemakers, including job counseling, training, and placement, as well as information on subjects such as financial management and health services. To the maximum extent possible, staff positions will be filled by displaced homemakers. Also, the board will study the feasibility of placing displaced homemakers in programs established or benefits provided under Federal and State unemployment compensation laws which extend eligibility to full-time homemakers.

Other laws. A Criminal History Records Act was passed, providing for the maintenance and dissemination of criminal records. An employer, upon request, is to be furnished records on a prospective employee which reflect convictions only or which pertain to an incident for which the prospective employee is currently within the system of criminal justice, including parole or probation.

The minimum hours of reasonably continuous employment required to complete an apprenticeship agreement was reduced from 4,000 hours to 2,000, and the requirement that apprentices be at least age 16 and preferably under 21 was removed.

Time spent as a member of the State legislature will not be considered a break in service for purposes of calculating employee benefits under private pension plans.

New Hampshire

Wages. The minimum wage rose to $2.90 an hour and will continue to increase each year to match Federal rates.

Permissible deductions from the minimum wage for food and lodging furnished to employees working in hotels, motels, and restaurants were increased.

The minimum wage law was amended to prohibit employers from hiring students at a subminimum wage rate or without compensation, to replace existing or laid off workers.

Child labor. Minors age 16 and 17 may now handle wine if working as grocery clerks, cashiers, or baggers. They now may also clean tables and lounge areas and move cases of alcoholic beverages in establishments serving such beverages, as long as they are not involved in serving drinks and an adult is in attendance.

Equal employment opportunity. Mandatory retirement was abolished for all public sector employees and for those in the private sector whose employers employ six workers or more.

Labor relations. The public employee labor relations law was amended to provide for three alternate members of the public employees labor relations board, and to increase from 30 to 45 days the time allowed both for holding hearings and making decisions on unfair labor practice charges. The issuance of a cease-and-desist order was made mandatory in cases of violation, and the board was given new authority to order payment of costs incurred by the injured party.

Displaced homemakers. A new law directed the labor commissioner to establish two pilot multipurpose centers to provide displaced homemakers with counseling, training, and job referral services to help them become gainfully employed.

Other laws. The minimum time for completion of an apprenticeship was reduced from 4,000 hours to 2,000.

The minimum contract amount on which public works contractors and subcontractors must furnish payment bonds was increased from $10,000 to $25,000.

Several State agencies are scheduled for sunset review and termination between July 1, 1981 and July 1, 1985, unless renewed by the legislature, including the labor department's divisions of administration and support, inspection, labor statistics, and workmen's compensation and the workmen's compensation commission.

New Jersey

Wages. The minimum wage rate was increased from $2.50 to $2.90 an hour on March 1, 1979, with a further increase to $3.10 on January 1, 1980. Full-time students may be employed by their college or university at not less than 85 percent of the minimum wage.

Child labor. Summer employment of minors between 16 and 18 years of age by a summer resident camp, conference, or retreat operated by a nonprofit or religious organization was exempted from the hours and nightwork restrictions of the child labor law, unless the work is primarily general maintenance or food service. Also they were exempted from posting and record-keeping requirements.

The ban on employment of minors where liquor is sold no longer applies to minors (between age 16 and 18) working in executive offices, maintenance departments, or pool or beach areas of hotels, motels, and guesthouses.

Displaced homemakers. A displaced homemakers act was passed requiring the Division on Women in the Department of Community Affairs to identify and maximize the use of existing displaced homemaker programs. The division is also to provide technical assistance and encouragement for the expansion of other multipurpose programs to provide displaced homemakers with job counseling, training and placement, and other services.

Other laws. Under a revision of the State penal code misdemeanor offense in other statutes which carries a penalty of 6 months imprisonment or less is reclassified as a disorderly persons offense. Violations of numerous laws, including child labor, minimum wage, prevailing wage, wage payment, industrial homework, and worker's compensation laws, are thereby reduced from crime class offenses to disorderly persons offenses. Among other consequences, these offenses now carry a statute of limitation of only 1 year, are lowered to the jurisdiction of magistrates' courts, and extradition authority is no longer available.

New Mexico

Wages. The minimum wage was increased from $2.30 an hour to $2.65 on July 1, 1979, with further increases to $2.90 on July 1, 1980, and to $3.35 on July 1, 1981. The farm rate will increase in four steps to $3.35 on July 1, 1982. All persons 18 years of age and under were exempted from the minimum wage law, except graduates of secondary, vocational, or training schools.

An increase from $2,000 to $20,000 was made in the threshold amount for coverage of public works contracts under the prevailing wage law.

The maximum amount of disposable earnings exempt from garnishment for child support was reduced to 50 percent; for all other types of garnishment, the exemption remained at the greater of 75 percent of disposable earnings or an amount each week equal to 40 times the Federal minimum hourly wage.

Equal employment opportunity. A State Agency on Aging was established which, among other duties, is to encourage training programs and opportunities for older workers and develop new job placement methods.

Private employment agencies. All regulation of private employment agencies ceased as of July 1, 1979, the result of previously adopted sunset legislation.

Occupational safety and health. Any civil penalty assessed the State or any political subdivision for a serious violation of the occupational health and safety act will be considered paid if the violation is corrected within the time permitted. Also, an employer now may be assessed a civil penalty of up to $1,000 for each violation of the law that is not of a serious nature.

Other laws. The Labor and Industrial Bureau in the Department of Human Services was abolished and an independent three-member Labor and Industrial Commission and an Office of Labor Commissioner established.

An employer who discharges or threatens to discharge an employee because of jury service will be guilty of a misdemeanor.

New York

Wages. By prior law, the minimum wage rate for nonagricultural workers was increased to $2.90 on January 1, 1979, with additional increases to $3.10 on January 1, 1980, and to $3.35 on January 1, 1981.

In resort hotels, tip credit allowances and maximum permissible deductions for meals and lodging were increased.

Child labor. Minors serving as members of a certified volunteer ambulance service now must be at least 15 years of age, have current Red Cross training, be under the supervision of an emergency medical technician, and be covered by workers' compensation.

Equal employment opportunity. Under the antidiscrimination law, the criterion for ascertaining disability for job purposes was redefined to cover a condition which does not prevent the person from performing the job in a reasonable manner, instead of a condition unrelated to ability to engage in activities involved in the job sought.

Labor relations. The provisions relating to mediation and arbitration for police and fire department contract disputes were extended to July 1, 1981, and the statute permitting an agency shop fee deduction from the wages of State employees was extended to September 1, 1981.

Occupational safety and health. An Office of Fire Prevention and Control was created in the Department of State to advise and assist in arson suppression, detection, investigation and prosecution, fire prevention and control, and other fire-service related problems. The office will be assisted by a fire safety advisory board in such functions as the evaluation and making of recommendations on Federal and State legislation and programs relating to fire safety service, policies, and programs.

Other laws. The education department was directed to make rules and regulations for school districts to supervise programs for minors required by the courts to perform public service work, assuring that certain labor standards are adhered to, including wages and other conditions of work, and workers' compensation coverage, and assuring that such minors are not used to replace regular employees.

A Long Island Job Development Authority was created to develop employment opportunities in Nassau and Suffolk Counties by assisting in the financing of business facilities likely to stimulate those opportunities, by advancing the development of eligible business enterprises, and by the annual formulation of an overall economic development plan for the bicounty region.

North Carolina

Wages. The former minimum wage, maximum hours, child labor, and wage payment laws were consolidated into a single wage and hour act. Major changes included an increase in the minimum wage rate from $2.50 to $2.75 an hour on July 1, 1979, with a future increase to $2.90 on July 1, 1980, extending minimum wage coverage to public employees, and requiring that overtime be paid after 45 hours a week instead of after 50 hours. The law also restricts what may be deducted from a worker's pay and makes violators of the minimum wage, overtime, and wage payment provisions liable for the unpaid wages plus up to an equal amount of exemplary damages.

The maximum amount of a parent's monthly disposable income subject to garnishment for court-ordered child support was increased from 25 to 40 percent.

Child labor. Several changes were made in the child labor provisions including adoption by reference of the federally banned hazardous occupations; elimination of work-hour restrictions for 16- and 17-year-olds; revision of the hour restrictions for 14- and 15-year-olds; and authorization for the labor commissioner to issue waivers in special circumstances and to impose civil penalties for violation of the law.

Pages working in the General Assembly or Governor's office were exempted from coverage under the minimum wage, overtime, child labor, and recordkeeping laws.

Agriculture. The Department of Human Resources was appropriated funds to pay for inpatient hospital care and related services for migrant farmworkers and their dependents while in the State.

Equal employment opportunity. The mandatory retirement age of public employees was raised from age 65 to 70, and the provision retained permitting continued employment beyond the retirement age on a year-to-year basis with employer approval.

The Wilmington city charter was amended to enable the city council to adopt ordinances prohibiting discrimination in employment and to establish an enforcement agency which will receive, initiate, and investigate complaints, and issue cease-and-desist orders for unlawful practices. New Hanover County was authorized to adopt ordinances prohibiting acts of employment discrimination based on race, color, national origin, gender, religion, handicap, or age.

Labor relations. Cities or counties may request that the Governor temporarily assign the State police to assist in local law enforcement if local police strike or engage in other job actions.

Private employment agencies. A new private employment agency law was enacted, replacing one that expired through sunset legislation. The new law includes establishment of an advisory council with authority to approve regulations promulgated by the labor commissioner.

Displaced homemakers. The Council on the Status of Women was authorized to establish a multipurpose center to provide counseling, training, education, and placement services to help displaced homemakers seeking employment. Whenever possible, the center will be staffed by displaced homemakers.

Other laws. The Governor now is to appoint a public member as chairperson of the Employment and Training Council, rather than serving as the chairperson himself. The council is to prepare an annual report to the Governor on its activities.

The number of hours of required on-the-job training in approved apprenticeship programs was reduced from 4,000 hours to 2,000.

Public utilities were permitted to obtain criminal records of applicants for or employees with jobs permitting or requiring access to nuclear power facilities or nuclear materials.

Vocational rehabilitation service functions for physically and mentally disabled persons were transferred from the State Board of Education to the Department of Human Resources, which is authorized to cooperate with the Federal Rehabilitation Services Administration in administering the Federal Rehabilitation Act.

North Dakota

Wages. Wage orders were revised to increase minimum rates for covered employee occupations, effective July 1, 1979. The new minimum for manufacturing is $2.95 an hour, and $2.60 an hour for public housekeeping with an additional increase to $2.80 on July 1, 1980. The new rates for mercantile employees and professional, technical, and clerical employees are $2.55 and $2.80 an hour, but will increase to $3.10 on January 1, 1980.

The $1,000 maximum was eliminated for the amount of any one wage claim which may be assigned to the labor commissioner for recovery by civil action.

Courts must now include in each judgment containing child support provisions an order directing the assignment of wages to meet the required payments. In the absence of a wage assignment, the courts are authorized to order employers to withhold wages for overdue child support. Employees are not to be discharged or disciplined because of such actions.

A concurrent resolution directs the legislative council to conduct a study of the feasibility and benefits of revising or repealing the State's wage garnishment law.

Equal employment opportunity. An equal employment opportunity law was enacted banning discrimination by employers of more than 15 employees on the basis of race, color, religion, sex, or national origin. The labor department is authorized to receive complaints and negotiate settlements within 60 days; district courts have jurisdiction over actions claiming violations.

Veterans previously granted preference in public employment if physically and mentally able to perform the duties of the position sought are now specifically required to meet the education and experience qualifications of the position as well.

Labor relations. A concurrent resolution requested that eligibility requirements of the Federal Food Stamp Act of 1964 be amended to prohibit striking employees from receiving government assistance.

Occupational safety and health. A new act gave the Industrial Commission authority to regulate the storage and disposal of nuclear and other wastes, including issuing permits and bringing civil action in the event of violation.

Provision was made for an annual fire inspection of all State institutions and buildings by the State fire marshal or by the fire department of the city or fire protection district in which the institution or building is located.

Displaced homemakers. A new law, effective until June 30, 1981, directed the Employment Security Bureau to establish a multipurpose service center and mobile unit to provide displaced homemakers with counseling, training, education, and placement services. Whenever possible, the centers will be staffed by displaced homemakers.

Other laws. The Sheltered Workshop Program became the Vocational Rehabilitation Facilities Program.

A resolution urges State agencies, departments, boards, and commissions to furnish the State employment service with information on their employment opportunities.

Ohio

Wages. Employers with less than $150,000 gross annual sales must pay a minimum wage of at least $1.50 per hour, compared to the $2.30 rate applicable to larger employers. Prior wage orders which set subminimum rates for certain industries with gross annual sales less than $95,000 were repealed.

A law enacted in late 1978 increased from $1,000 to $2,500 the amount of final wages an employer may pay to eligible survivors of a deceased employee without letters of testament.

Equal employment opportunity. Age discrimination is now prohibited under the Civil Rights Act for persons between 40 and 70. An earlier separate age discrimination law, enforceable through civil action by the aggrieved individual, was extended to include these ages, instead of 40 to 65.

Prohibitions on discrimination because of sex will now include pregnancy or illness arising from pregnancy or childbirth. Employers are not required to pay for health insurance benefits for abortions, except where the mother's life is endangered or where complications arise from an abortion.

Other laws. The required period of on-the-job work experience for apprentices was reduced from 4,000 hours to 2,000. A new law gives employees the right, upon written request, to obtain copies of all their medical records that are in the possession of their current or past employer. Violation of the law will be a misdemeanor.

Oklahoma

Private employment agencies. The private employment agency advisory council was terminated on July 1, 1979, the result of previously adopted sunset legislation.

Oregon

Wages. The minimum wage rate in the nonfarm sector was increased from $2.30 to $2.65 an hour on July 1, 1979, with additional increases to $2.90 on January 1, 1980, and $3.10 on January 1, 1981.

The Wage and Hour Commission is no longer authorized to set subminimum wage rates for minors under 18 years of age. Instead, it may set a rate at 75 percent of the regular rate for student-learners who are employed on a part-time basis pursuant to a bona fide vocational training program. The State Board of Education is to adopt certificate procedures for this new student-learner category.

Seasonal educational or organized camps with an annual gross income of less than $275,000 and nonprofit conference centers operated for educational, charitable, or religious purposes were exempted from the minimum wage law.

The labor commissioner now may seek collection of wage claims through administrative proceedings, in addition to taking court action. Wage claims were changed to specifically include damages or civil penalties due employees in connection with claims for unpaid wages.

A worker's weekly disposable wages which exceed 36 times the Federal minimum (previously 40 times) is now subject to garnishment, with the same maximum of 25 percent of disposable earnings remaining in effect.

The Support Enforcement Division of the Justice Department may now use contempt proceedings to enforce garnishments or orders for withholding of wages for support payments, whether or not a request has been made by the designated recipient.

State employees are permitted to authorize the direct deposit of their salary or wages and loan payments to designated banks, savings and loan associations, or credit unions.

Child labor. State law now permits minors 16 and 17 years of age to work as assistants on chartered fishing or pleasure boats, and those age 14 and 15 to work at the dock areas. Minors under age 18 may work on commercial fishing vessels without an employment permit, when employed and supervised by a relative.

Agriculture. Each application for a license to operate as a farm labor contractor now must contain a written sworn declaration appointing the labor commissioner as the contractor's agent to accept a service of summons when the contractor is not available to accept service. The labor commissioner was given new authority to assess civil penalties, and workers were guaranteed a right of action against a contractor who violates the law.

Equal employment opportunity. The provision making it an unlawful employment practice for an employer to discriminate on the basis of physical or mental handicap was expanded to apply to labor organizations and employment agencies. Handicap was redefined as an impairment which substantially limits one or more major life activities.

Refusal of an employer to reinstate a disabled worker to his former position or to available and suitable employment if disabled on the job now will be considered an unlawful employment practice.

Labor relations. The Employment Relations Board may award attorney fees to the prevailing party in a hearing to determine if a public employer engaged in unfair labor practices.

Economic or financial inconvenience to the public or public employer normally incident to a strike by public employees is no longer a basis for the granting of an injunction.

Group health insurance policies now must contain provisions permitting employees to continue their coverage by paying both employer and employee contributions during a strike or lockout.

It was made an unlawful employment practice for an employer to require an employee to pay for a medical examination or health certificate as a condition of continued employment, unless the examination is required by a collective bargaining agreement or by statute or ordinance or payment is made by a health benefit plan financed entirely by the employer.

Private employment agencies. Management consultants or executive recruiters may not make placements in positions paying less than $30,000 per year, instead of the previous $20,000, to qualify for exemption from the employment agency law.

Occupational safety and health. The Department of Energy was made primarily responsible for establishing rules for health protection and for the evacuation of people and communities affected by radiation in the event of an accident or castastrophe involving a nuclear power plant or installation.

Displaced homemakers. The displaced homemaker law extended coverage to persons who are on public assistance because of dependent children in the home (especially in cases where aid will terminate within a year because of the youngest child reaching age 18) and to persons underemployed and experiencing difficulty in getting better jobs. Job placement and job development were added to existing services.

Other laws. Courses of study for apprentices and trainees were expanded to include all trades and crafts. These courses may be implemented without approval of the State Apprenticeship and Training Council and State Apprenticeship Committee, if the industry provides the facilities, and the instructors meet industry skill and training requirements.

The number of reasonably continuous hours of employment required to complete apprenticeship training was reduced from 4,000 hours to 2,000, and provision was made for the reciprocal approval of multistate apprenticeship programs and standards of employers and unions in industries other than building and construction.

Workers who incur damages as a result of being induced to change their place of employment through false advertising or false pretenses now are entitled to recover all damages, or $500, whichever is greater, instead of actual damages alone.

It is now unlawful, under the fair employment practices act, for an employer to require an employee or prospective employee to take a polygraph examination or psychological stress test. The State has a separate law prohibiting the use of lie detector tests as a condition of employment or continued employment.

Pennsylvania

Wages. As provided for in a prior law, the minimum wage rate was increased from $2.65 to $2.90 an hour on January 1, 1979, with future increases to $3.10 on January 1, 1980, and $3.35 on January 1, 1981. The increases are identical to those under the Federal law. As of January 1, 1979, entitlement to overtime pay for hotel, motel, and restaurant employees began after 40 hours a week rather than the previous 44. The maximum tip credit will be reduced from 45 to 40 percent of the minimum rate on January 1, 1980.

Equal employment opportunity. By an amendment adopted in late 1978, it is not an unlawful employment practice for a religious corporation or association, because of its religious beliefs or practices, to refuse to hire or employ on the basis of sex.

Other laws. A Criminal History Information Act was enacted late in 1978 providing for the protection of individual right to privacy and establishing regulations concerning the dissemination of criminal history record information. Individuals or their legal representatives may review, challenge, correct, and appeal the accuracy and completeness of the information. The State may refuse to license and employers may refuse to hire persons who have been convicted of a felony or of a misdemeanor which relates to the trade or occupation for which a license is sought or which relates to the applicant's suitability for employment.

Another law, enacted late in 1978, gave employees the right to inspect their personnel files, upon written request, and to insert counter statements in the event of an alleged error. Employers are to make these records available during regular business hours, but may require the employees to use their free time for inspection.

Rhode Island

Wages. The minimum wage rate was increased from $2.30 an hour to $2.65 on July 1, 1979, with additional increases to $2.90 on July 1, 1980, $3.10 on July 1, 1981, and $3.35 on July 1, 1982. Youth and student rates were also increased.

Employees of organized camps, which do not operate for more than 7 months a year, who are not employed on an annual full-time basis are now exempt from the minimum wage law.

Court-ordered wage garnishment for the payment of delinquent child support was authorized, and firing employees or discriminating against job applicants as a result of such court-ordered payments was prohibited.

Equal employment opportunity. The fair employment practices act was amended to prohibit age discrimination against persons between age 40 and 70. The State has a separate age discrimination law protecting the 45 to 65 age group.

Labor relations. A State police arbitration law was enacted providing for binding arbitration of all contract disputes, including those involving wages, and reaffirming the public policy that full-time members of the State police force have all the rights of organized workers, except the right to strike or engage in a work stoppage or slowdown.

An employer's failure to implement an arbitrator's award will be an unfair labor practice unless a court issues a stay of the award.

Industrial homework. The distribution of goods for processing to any person in any industry where it has been proven that homework is not susceptible to effective regulation, is now prohibited, unless the person receiving the goods has been issued a contractor's permit by the labor department. The processing of goods owned by another is prohibited without such a permit, and no contract shop may operate in a home.

Occupational safety and health. Various changes were made in provisions dealing with electrical, boiler, and fire safety codes, and the health and safety law on explosives was revised.

Other laws. The required period of on-the-job experience for apprentices was reduced from 4,000 to 2,000 hours, and a statement was included providing for conformance of the apprenticeship program with State law, including equal employment opportunity standards and regulations.

To aid and promote the development of the domestic steel industry, all public work contracts must include a provision that domestic steel will be used unless its cost exceeds by 15 percent any other steel products obtainable.

South Carolina

Agriculture. The migrant farmworkers commission is to develop an accurate statewide census of migrant and seasonal farmworkers and to determine the cost of supportive programs associated with such workers. The migrant labor division of the labor department was designated the administration agency of the commission.

Equal employment opportunity. The human affairs law, formerly applicable to public employees only, was extended to private sector employers of 15 or more workers, labor organizations, employment agencies, and joint apprenticeship committees and was revised to become a comprehensive antidiscrimination law prohibiting employment discrimination on the basis of race, religion, color, sex, age (between 40 and 70), or national origin. Violation will be an unlawful employment practice. The commission on human affairs was given enforcement authority, including authority to order hiring, reinstatement, and backpay.

The mandatory retirement age for teachers was increased from 65 to 70, with an extension to 72 possible upon approval of annual requests.

Occupational safety and health. The labor commissioner was empowered to seek administrative search warrants from the circuit court when authorized inspectors make proper requests to inspect certain premises or property for occupational safety or health purposes and are denied access.

South Dakota

Child labor. The alcoholic beverage control law was amended to prohibit persons under 21 years of age from selling, serving, or dispensing alcoholic beverages in "off-sale" liquor establishments.

Equal employment opportunity. The mandatory retirement age was raised from 65 to 70 years for public employees, except law enforcement officers and firemen for whom the retirement age remains at 55.

A legislative study will be made of handicapped persons' access to employment, programs, and services. A plan outlining changes which can be made by State and local governments will be presented to the next legislature.

Private employment agencies. A requirement that all registrations for employment or help be shown on the monthly report submitted to the labor department was removed from the law.

Occupational safety and health. The Secretary of the Department of Transportation was authorized to adopt rules and regulations providing for the safe transportation of radioactive materials on the State's roads and highways and to provide appropriate emergency procedures in the event of any accident.

Displaced homemakers. The secretary of the labor department was authorized to establish a pilot multipurpose service center to provide job counseling and placement, health, financial, educational, and legal services to displaced homemakers. Whenever possible, staff positions will be filled by displaced homemakers.

Tennessee

Wages. Deductions will be required from the pay of "employed releasees" from prison toward the cost of their supervision and rehabilitation, and for contributions to the criminal injuries compensation fund.

Equal employment opportunity. The mandatory retirement age of 70 was eliminated from the retirement system for State employees, except for police officers, firefighters, wildlife officers, and State university employees.

A procedure was established permitting persons alleging discrimination in employment on the basis of a handicap to file complaints with the State human development commission.

Employment discrimination against a blind person because of the use of a guide dog is now prohibited.

A joint resolution was adopted urging county legislative bodies to establish human development commissions and to adopt ordinances prohibiting discrimination on the basis of race, creed, color, religion, sex, or national origin.

Labor relations. Labor negotiating sessions between employee unions and public employers must be open to the public.

Occupational safety and health. A mine rescue corps was created under the direction and control of the labor department, replacing the previous system of owner or union-selected rescue units subsidized by the State.

Other laws. Procedures were established for the issuance of administrative warrants authorizing labor department employees to make inspections and seize evidence.

Violation of the law requiring the deposit of pension and retirement funds in a separate trust account was made a felony punishable by imprisonment of 1 to 3 years, a fine of up to $10,000, or both.

A joint resolution requested the establishment of a special legislative committee to study the problem of teenage unemployment, focusing on minors 16 to 20 years of age.

All employable persons receiving assistance under the Aid to Families with Dependent Children program now must accept jobs or training through the public employment service, or lose the public assistance.

Texas

Child labor. Students or apprentices enrolled in public school vocational education programs were exempted from the child labor law.

Private employment agencies. The private employment agency law administered by the labor department was repealed and a new law enacted which limits the labor department's authority to the issuance of operating licenses. Parties aggrieved by the activites of agencies must now institute court action to obtain relief.

School districts were prohibited from listing job vacancies with private employment agencies, paying them a fee, and employing applicants referred by such agencies.

The labor agency law which applies primarily to the recruitment of agricultural workers was amended to authorize the labor commissioner to suspend as well as revoke the licenses of labor agents. Each worker recruited must now be furnished with information on the terms and conditions of employment.

Other laws. The home addresses and telephone numbers of peace officers were listed among the items specifically excluded from records available to the public under the State open records act.

Utah

Wages. An increase in the minimum wage to $2.45 an hour, authorized by a 1978 administrative action, took effect on January 1, 1979 for the retail trade, public housekeeping, restaurant, and laundry, cleaning, dyeing and pressing industries in

Salt Lake, Weber, Utah and Davis counties and in all cities with a population of 5,000 or more. Further increases to $2.60 and $2.75 are scheduled for January 1, 1980, and January 1, 1981. The minimum for other areas was raised to $2.20 an hour with further increases scheduled on the above dates to $2.35 and $2.50

Equal employment opportunity. The antidiscrimination act was amended to include coverage for physically and mentally handicapped persons, and to remove the 65-year upper age limit on age discrimination protection. State officers and employees will now be governed by the antidiscrimination or unfair employment practices provisions of the act. The Antidiscrimination Division of the Industrial Commission will investigate any alleged violation and report its findings to the newly created Personnel Review Board.

The legislature approved an amendment to the State constitution, to be voted on at the next general election, which would remove the prohibition against women working underground in mines and would permit work release and similar programs for prisoners.

A joint resolution opposed granting an extension of the time limit for ratification of the proposed Federal Equal Rights Amendment or any other amendment to the U.S. Constitution.

Occupational safety and health. A Hazardous Wastes Committee was established in the Division of Health to issue regulations for managing and controlling the transportation, storage, treatment and disposition of hazardous waste, and to carry out inspections, hold hearings, and secure compliance.

Vermont

Wages. By prior law, the minimum wage rate was raised to $2.90 an hour on January 1, 1979, with future increases to $3.10 on January 1, 1980, and $3.35 on January 1, 1981.

The Federal wage garnishment exemptions of 75 percent of disposable weekly earnings or 30 times the Federal minimum wage, whichever is greater, were adopted. Discharge of employees as a result of wage garnishment was prohibited.

Equal employment opportunity. The responsibilities and functions of the Governor's Committee on Employment of the handicapped were transferred to the nonprofit organization, Handicapped Opportunities and Programs in Employment, to create Statewide interest and cooperation in promoting rehabilitation and employment of the handicapped.

Virginia

Wages. Students enrolled in work-study or equivalent programs administered by any secondary school, college, or trade school now may be paid monthly, rather than biweekly as usually required.

Child labor. Restrictions concerning night work, maximum hours, and employment certificates were eliminated for 16- and 17-year-old minors. Other changes gave the labor commissioner specific authority to declare occupations hazardous, and remove the exemption for any minor employed in the gathering or processing of seafood. Minors age 14 to 16 now may work in parking lots, as swimming pool lifeguards, as gatekeepers, or in concessions at any public hotel or motel pool. Minors under age 16 employed by their parents in nonhazardous occupations were exempted from the child labor law, and badges are no longer required for street trade employment.

The alcoholic beverage control law was amended to permit establishments which serve alcoholic beverages to employ persons under 18 years of age to bus tables and seat customers in areas where meals are purchased.

Equal employment opportunity. A 16-member equal employment opportunity committee was created to monitor the State's practices in providing equal opportunity to all public employees and job applicants.

The commission for the visually handicapped was directed to cooperate with the Federal Government in administering laws which provide vocational education and other services necessary for the rehabilitation of blind or visually handicapped persons.

Labor relations. If a utility, its employees, or the union fail to give the required 30 days' notice of a proposed termination or modification of a collective bargaining contract or work stoppage, the other party may file for an injunction against such action. The court may impose a fine of up to $100 against each person and up to $1,000 against a union for each day the action continues.

Private employment agencies. Payment of per diem and expenses to members of the employment agency advisory board was authorized.

Occupational safety and health. Several changes were made in the occupational safety and health law, including prohibiting retaliation against employees who have filed complaints, testified or otherwise exercised their rights under the act; revising the provisions on issuing and appealing citations and the imposition of penalties; and permitting the labor commissioner to delegate authority concerning occupational health to the State health commissioner.

The labor commissioner was given authority to make occupational safety and health inspections of any workplace with the consent of the owner or under an inspection warrant. Also, the law providing for court-ordered inspection warrants relating to toxic substances was amended to specifically provide for entry to the premises and for testing or collection of samples for testing during the inspection.

Several revisions were made in sections of the health law pertaining to migrant labor camps. Specific sanitary and safety requirements were deleted and are now left to regulations adopted by the board of health and the safety and health codes commission. These requirements may be no more stringent than those actually enforced by the U.S. Department of Labor pursuant to Federal law.

By January 1, 1980, the office of emergency services was to monitor the transportation within the State of those hazardous radioactive materials that could pose a significant potential danger in the event of accidental spillage or release.

Other laws. Prior to starting work on construction contracts of more than $500,000 let by the State or any water, sewer, or sanitation authority, bidders must submit written assurances that they operate an apprenticeship program registered with the State apprenticeship council or are exploring the feasibility of establishing and registering such a program.

Permits issued by the U.S. Department of Labor will no longer constitute proof of eligibility for employment of aliens in the State. U.S. Department of Justice permits will continue to be acceptable and employment of an alien worker who cannot provide this document is illegal.

Washington

Agriculture. A migrant labor housing project in Yakima County, scheduled to end December 1, 1978, was continued until June 30, 1981.

Equal employment opportunity. The mandatory retirement age was raised from 65 to 70 for all public employees, except police officers and firefighters, and compulsory retirement at age 70 may be waived by an individual's employer.

Private employment agencies. The State's sunset law was amended to remove the employment agency advisory board from the list of agencies scheduled for termination on June 30, 1979.

Displaced homemakers. A 2-year pilot project was established under which the council for postsecondary education is to contract for multipurpose service centers and programs to provide training opportunities, counseling, job placement, and other services for displaced homemakers. Staff positions at the centers are to be filled by displaced homemakers, where possible.

Other laws. Hours of training required under apprenticeship agreements were reduced from 4,000 to 2,000 hours of reasonably continuous employment.

A sunset law abolished several regulatory agencies and boards on various future dates, including the labor department's contractor registration program scheduled for termination on June 30, 1983.

Employers may not require assignment of an employee's rights to an invention for which no equipment, supplies, facilities, or trade secrets of the employer were used and which was developed entirely on the employee's own time, unless the invention relates directly to the employer's business, actual or anticipated research, or results from work performed by the employee for the employer.

Wisconsin

Wages. By administrative action, taken in 1978, the nonfarm minimum hourly wage rate was increased from $2.55 to $2.80 on January 1, 1979, with further increases on January 1 to $3 in 1980, and $3.25 in 1981. The farm rates were increased from $2.35 to $2.60 an hour on January 1, 1979, with further increases to $2.80 and $3.05 scheduled for 1980 and 1981.

Wyoming

Wages. An increase from $5,000 to $25,000 was made in the dollar threshold of the prevailing wage law.

Hours. Nonemergency overtime beyond 8 hours and up to 16 hours a day now is permitted in underground mines by mutual agreement of the employee and employer. Employers may not take punitive action against employees who decline to agree.

Child labor. Minors under age 16 may now be employed as dishwashers, "busboys" or delivery persons in places where alcoholic liquors and malt beverages are sold.

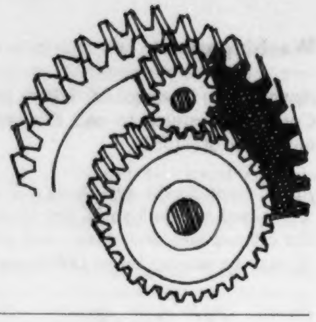
Equal employment opportunity. A discriminatory or unfair employment practice complaint now must be filed with the fair employment practice commission within 90 days of the alleged violation, and the commission was directed to issue cease-and-desist orders within 6 months of the hearing. Time limits previously were not included in the law.

Other laws. A sunset law terminated several regulatory agencies and boards, including the occupational safety and health commission, on July 1, 1981, unless continued or reestablished by the legislature.

———*FOOTNOTE*———

[1] Kentucky was the only State where the legislature did not meet in 1979. Session was held in West Virginia, but no significant labor legislation was enacted. Puerto Rico and the Virgin Islands were not included in the study.

Productivity Reports



Productivity increased in 1978 in most industries measured

ARTHUR S. HERMAN

Productivity in 1978, as measured by output per employee-hour, increased in about two thirds of the industries for which the Bureau of Labor Statistics regularly publishes data. However, productivity growth was lower and declines were greater for more than half of the industries, during 1978, as compared with 1977. This slowdown is consistent with the state of the nonfarm business sector of the economy, where productivity grew 0.5 percent in 1978 as compared with 1.6 percent in 1977. Table 1 shows productivity trends in industries measured by the Bureau and includes new measures for the fluid milk, folding paperboard boxes, and soaps and detergents industries.[1] It also includes, for the first time, a number of series that are components of previously published measures, and were developed by disaggregating the existing measures: canned fruits and vegetables; raw and refined cane sugar; beet sugar; brick and structural clay tile; ceramic wall and floor tile; household cooking equipment; household refrigerators and freezers; household laundry equipment; household appliances, not elsewhere classified; and primary copper.

Productivity changes in 1978, by industry

Manufacturing. The steel industry, one of the more important industries surveyed, recorded an above-average gain in productivity of 4.4 percent. Demand was up in a number of steel markets, including the construction, and machinery and equipment industries, resulting in a gain in output of 7.4 percent, while employee hours grew by 2.9 percent. The motor vehicles industry, on the other hand, posted a productivity decline of 1.6 percent as compared with a gain of 6.4 percent in 1977. Output in this industry was below the average gain of 2.7 percent, while employee hours grew 4.4 percent. Productivity was affected by a substantial shift to smaller cars resulting in production cutbacks and slower assembly line speeds in large-car plants, as well as by additional hiring and capacity strains in small-car plants.

Among other manufacturing industries, the largest gain was posted in the household cooking equipment industry, up 9.3 percent. Output grew 14.4 percent, buoyed by rapid sales gains for microwave ovens. Large gains were also posted for malt beverages, up 8.4 percent; household appliances, not elsewhere classified, up 7.0 percent; cigarettes, up 5.5 percent; and soft drinks, up 5.1 percent. Conversely, sharp declines were recorded by a number of industries, including primary copper, lead, and zinc (6.6 percent); household laundry equipment (5.4 percent); primary smelting and refining of copper (5.1 percent); sugar (4.2 percent); folding paperboard boxes (3.5 percent); and primary aluminum (3.1 percent).

Mining. Most of the mining industries experienced productivity increases. Coal mining recorded a large gain of 8.7 percent in 1978, in contrast to the declines recorded in almost every year over the past decade. This gain reflected a decline in output of 5.1 percent, and a sharp drop in production worker hours of 12.6 percent; the industry was affected by a major strike in 1978. Copper mining (recoverable metal) also posted a large increase, 8.3 percent. Output was down 0.5 percent in this industry while production worker hours declined further, 8.1 percent. In iron mining (usable ore) productivity grew by 4.7 percent as the industry recovered from a strike in 1977. Output in the iron ore industry showed a very large gain of 45.5 percent, with production worker hours up 38.8 percent. Nonmetallic minerals, however, had a slight decline in productivity of 0.3 percent.

Transportation. Productivity was up in most transportation industries, as their output grew because of general-

---

Arthur S. Herman is an economist in the Division of Industry Productivity Studies, Bureau of Labor Statistics.

ly favorable conditions in the overall economy. In the railroad industry, productivity was up by a record breaking 12.2 percent, as output grew 3.3 percent and employee hours fell 7.9 percent. Productivity in air transportation showed a high gain of 9.3 percent, based on an above average gain in output of 13.9 percent, and a gain in employment of 4.2 percent. Conversely, intercity trucking, posted a small productivity decline of 0.2 percent, with general freight showing a much greater decline of 1.4 percent.

Other industries. Telephone communications posted a productivity gain of 6.6 percent, hotels and motels was up 4.3 percent, gasoline service stations grew 4.0 percent, and laundry and cleaning services was up 1.0 percent. Declines were posted by eating and drinking places (4.2 percent), retail food stores (3.9 percent), new car dealers (2.0 percent), and gas and electric utilities (1.6 percent).

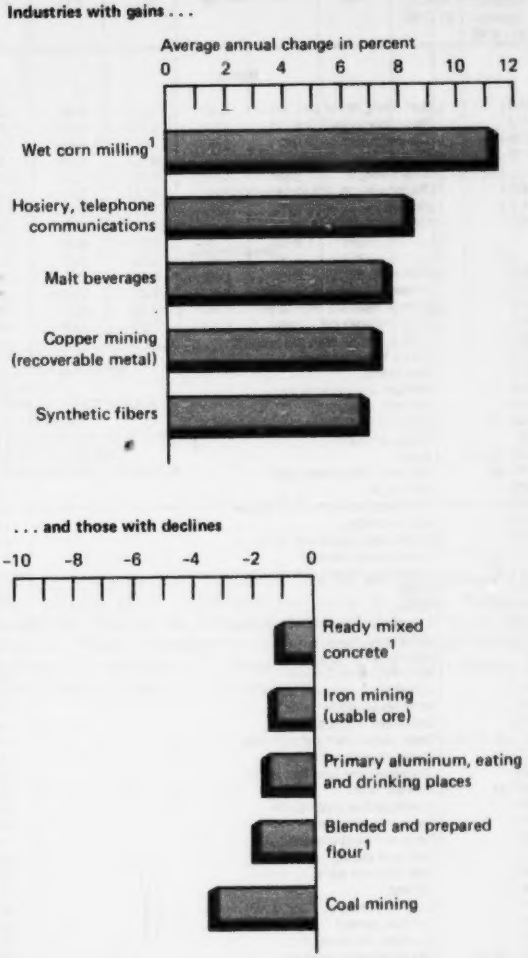
Trends 1973–78

All of the industries registered gains over the long term (generally 1947 or 1958 to 1978). During the most recent 5 year period, 1973–78, more than half of the industries recorded gains that were equal to or greater than the 1.3-percent rate of the nonfarm business sector of the economy. Chart 1 shows industries with significant productivity changes over the 1973–78 period.

Gains. In recent years the wet corn milling industry posted the highest productivity gain, 11.2 percent during 1973–77. (1978 data were not available.) Productivity in this industry was aided by a sharp rise in output, as markets for high fructose syrup, one of the industry's key products, expanded greatly. In addition, a number of new plants, utilizing the latest computerized controls, came into operation during this period. Other industries with high rates over the 1973–1978 period, included hosiery and telephone communications, which both grew at an 8.1 percent annual rate. Recent advances in hosiery knitting machine speeds, automated dyeing techniques, and new packaging equipment have contributed to the advance in output per employee-hour. In telephone communications the utilization of electronic switching for long-distance service has contributed to growth in productivity.

Another industry posting a high rate of productivity gain was malt beverages, which grew at a rate of 7.5 percent. Productivity benefited from the introduction of large automated breweries, and a decline in small, inefficient establishments. Other industries with high rates of gain included copper mining (recoverable metal), 7.0 percent; synthetic fibers, 6.4 percent; bottled and canned soft drinks, 6.2 percent; and prepared feeds for animals and fowl, 6.2 percent.

Chart 1. Selected industries with substantial gains and declines in productivity, 1973-78



[1] Rate of change is for 1973-77

Declines. Among the industries that experienced declining productivity rates over the 1973–78 period, the coal mining industry fell the most, down 3.5 percent per year on the average. Others included blended and prepared flour (1.9 percent); primary aluminum, and eating and drinking places (1.5 percent); iron mining usable ore (1.3 percent); ready mixed concrete (0.9 percent); steel, and motors and generators (0.7 percent); steel foundries, wood household furniture, and soaps and detergents (0.6 percent); retail food stores (0.2 percent); and folding paperboard boxes (0.1 percent).

Table 1. Indexes of output per employee hour[1] in selected industries, 1972–78, and percent changes 1977–78, 1973–78

[1967 = 100]

SIC Code[2]	Industry	1972	1973	1974	1975	1976	1977	1978[3]	Percent change 1977–78	Annual average percent change 1973–78

[1] Although the output per employee-hour measures relate output to the hours of all employees engaged in each industry, they do not measure the specific contributions of labor, capital, or any other single factor of production. Rather, they reflect the joint effects of many influences, including new technology, capital investment, the level of output, capacity utilization, energy use, and managerial skills, as well as the skills and efforts of the work force. Some of these measures use a labor input series that is based on hours paid, and some use a labor input series that is based on plant hours.

[2] As defined in the 1972 Standard Industrial Classification Manual, published by the Office of Management and Budget.

[3] Preliminary.

[4] Mining data refer to output per production worker hour.

[5] Not available.

[6] Average annual rate of change is for 1973–77.

[7] Output per employee.

[8] Output per hour of all persons.

A full report, "Productivity Indexes for Selected Industries," 1979 Edition, Bulletin 2054, is being prepared and will be available from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

---

[1] For a detailed report on these industries see the *Monthly Labor Review* articles: Elmer S. Persigehl and James D. York, "Substantial productivity gains in the fluid milk industry," July 1979, pp 22–27; Patricia S. Wilder, "Productivity in the soaps and detergent industry" (forthcoming); and James D. York, "Productivity in the folding paperboard boxes industry" (forthcoming).

Family Budgets

Family budget increases in 1978 were the largest in 4 years

The Bureau of Labor Statistics' hypothetical budgets for a family of four and a retired couple increased at faster rates between the autumns of 1977 and 1978 than in the previous 3 years. The increases, reflecting only price and personal income tax changes, ranged from 8.8 percent to 10.2 percent for the four-person family, and 7.7 percent to 8.5 percent for the retired couple.

Budget costs for an urban family of four averaged $11,546 a year at the lower level, $18,622 at the intermediate level, and $27,420 at the higher level. The costs for a retired couple, excluding taxes and deductions, averaged $5,514 at the lower level, $7,846 at the intermediate level, and $11,596 at the higher level.[1] For the four-person family, food costs and personal taxes increased by the greatest amount, while for the retired couple, food and medical care expenditures reflected the largest increases. (See table 1.)

Measuring hypothetical spending patterns

Significant changes were made in the method of updating family budgets for some local areas as a result of the Consumer Price Index Revision Program, which was completed in January 1978.

The family budgets represent the costs of three hypothetical lists of goods and services that were specified in the mid-1960's to portray three relative standards of living—lower, intermediate, and higher—for each of two precisely specified types of family. The four-person family consists of a 38-year-old husband employed full time, his nonworking wife, a boy of 13, and a girl of 8. The retired couple consists of a husband, age 65 or over, and his wife.

For each budget level, the families have average inventories of clothing, housefurnishings, major durables,

Table 1. Annual budgets for urban families of four and for retired couples, at three levels of living, autumn 1978, and percent changes, autumn 1977 to autumn 1978

Component	Lower				Intermediate				Higher

Other family consumption[3]	515	5.5	330	5.3	956	6.2	500	5.5	1,578	6.5	762	6.1
Other items[4]	500	8.4	237	8.2	810	8.2	472	8.5	1,365	6.0	875	7.1
Taxes and deductions[5]	1,654	22.3	.....	....	3,811	15.4	.....	....	6,830	14.5	.....	....
Social security and disability	719	13.8	.....	....	1,073	11.7	.....	....	1,091	10.8	.....	....
Personal income taxes	935	29.9	.....	....	2,738	16.9	.....	....	5,739	16.2	.....	....

[1] On the assumption that the home was purchased 6 years ago, these costs reflect changes in principal payments and mortgage interest rates from 1971 to 1972, and changes in property taxes, insurance, fuel and utilities, and repairs and maintenance from 1977 to 1978.

[2] For retired couple, "medical care" includes a preliminary estimate for "out-of-pocket" costs for medicare.

[3] For both families, "other family consumption" includes average costs for reading, recreation, tobacco products, alcoholic beverages, and miscellaneous expenditures. Costs for education are also included for 4-person families.

[4] For 4-person families, "other items" includes allowances for gifts and contributions, life insurance and occupational expenses. For retired couples the categories includes allowance for gifts and contributions and, in the higher budget, life insurance.

[5] Beginning with the autumn 1973 updating of the budget for a retired couple, the total budget is defined as the sum of "total family consumption" and "other items." Therefore, income taxes are not included in the total budgets for retired couples.

NOTE: Because of rounding, sums of individual items may not equal totals.

and other articles. The budgets pertain only to urban families with these specified characteristics. No budgets are available for rural families. The budgets are not intended to represent a minimum level of adequate income or a subsistence level of living, nor do they indicate how families do or should spend their money.

Consumption costs. For the four-person family, consumption costs rose 8.5 percent in the lower budget, 7.4 percent in the intermediate budget, and 7.1 percent in the

[1] For these urban areas, 1978 costs were estimated using CPI price changes for the appropriate region/population size class.

[2] The family consists of an employed husband, age 38, a wife not employed outside the home, an 8-year-old girl, and a 13-year-old boy.

[3] The average costs of automobile owners and nonowners in the intermediate budget were weighted by the following proportions of families: Boston, New York, Chicago, and Philadelphia, 80 percent for owners, 20 percent for nonowners; Baltimore, Cleveland, Detroit, Los Angeles, Pittsburgh, San Francisco, St. Louis, and Washington, D.C. with populations of 1.4 million or more in 1960, 95 percent for automobile owners and 5 percent for nonowners; all other areas, 100 percent for automobile owners.

[4] Housing includes shelter, house furnishings, and household operations.

[5] Renter costs include average contract rent plus the cost of required amounts of heating fuel, gas, electricity, water, specified equipment, and insurance on household contents.

[6] Homeowners costs include interest and principal payments plus taxes; insurance on house and contents; water, refuse disposal, heating fuel, gas, electricity and specified equipment; and home repairs and maintenance costs.

[7] In total medical care, the average costs of medical insurance were weighted by the following proportions: 30 percent for families paying full cost of insurance, 26 percent for families paying half cost, 44 percent for families covered by noncontributory insurance plans (paid by employer).

[8] Other family consumption includes average costs for reading, recreation, tobacco products, alcoholic beverages, education, and miscellaneous expenditures.

[9] As defined in 1960–61. For a detailed description of these and previous geographical boundaries, see the 1967 edition of *Standard Metropolitan Statistical Areas*, prepared by the Office of Management and Budget.

[10] Places with population of 2,500 to 50,000.

* For these urban areas, 1978 costs were estimated using CPI price changes for the appropriate region/population size class.

[1] The family consists of a retired husband and wife, age 65 years or over.

[2] Total budget costs do not include personal income taxes.

[3] Housing includes shelter, housefurnishings, and household operations.

[4] Renter costs include average contract rent plus the cost of required amounts of heating fuel, gas, electricity, water, specified equipment, and insurance on household contents.

[5] Homeowner costs include property taxes, insurance on house and contents, water, refuse disposal, heating fuel, gas, electricity, specified equipment, and home repair and maintenance costs.

[6] The average costs of automobile owners and nonowners in the intermediate budget were weighted by the following proportions of families: New York, 25 percent for owners, 75 percent for nonowners; Boston, Chicago, Philadelphia, 40 percent for owners, 60 percent for nonowners; all other metropolitan areas, 60 percent for owners; 40 percent for nonowners; nonmetropolitan areas, 68 percent for owners, 32 percent for nonowners.

[7] Includes average costs for reading, recreation, tobacco products, alcoholic beverages and miscellaneous expenditures.

[8] As defined in 1960-61. For a detailed description of current and previous geographical boundaries, see the 1967 edition of *Standard Metropolitan Statistical Areas*, prepared by the Office of management and Budget.

[9] Places with population of 2,500 to 50,000.

higher budget. For the retired couple, costs for consumption increased 8.5 percent in the lower budget, 8.2 percent in the intermediate budget, and 7.8 percent in the higher.

Medical care costs increased approximately 13 percent for the retired couple. The prior year's medical care costs for a retired couple were revised to reflect a large upward revision in preliminary out-of-pocket Medicare costs. (Copies of the 1977 revised data for the budget areas are available from any BLS regional office.)

Homeowner costs increased about 2 percent for both families due to reduction of property taxes in California, and small changes in principal and interest payments for the four-person family. The Bureau's methodology assumes that the retired couple has completed its mortgage payments. Changes in the retired couple's housing expenses reflect changes in the other homeowner costs.

Tax changes. Personal income taxes shown in the three budgets include estimated 1978 Federal, State, and local payments. Changes in the Federal tax code between 1977 and 1978 did not apply to the type of family assumed in the budgets. However, changes in tax codes affecting these budgets did occur in a number of States. The Federal income tax structure, as well as that of many States, calls for higher rates corresponding to higher incomes. The net result between the 2 years was that personal income taxes increased approximately 30 percent at the lower level, 17 percent at the intermediate level, and 15 percent at the higher level.

The increases contrast sharply to the 1977 income tax changes, when budget taxes decreased 12.7 percent for the lower level, but the intermediate and higher levels rose 4.7 and 9.1 percent from the prior year. As a net result of increases in budget costs, the 1977 Federal tax changes, and State and local tax changes between 1976 and 1978, the ratio of personal income taxes to total budget has remained 8 percent for the lower level families. The ratio for the intermediate increased from 13.8 to 14.7 percent, and for the higher, from 19.2 to 20.9 percent.

Differences among urban areas. Area indexes in table 2 and 3 for both families reflect differences not only in price levels but also in consumption patterns, climate, types of transportation facilities, and, in the four-person budget, in State and local income tax regulations.[2]

Method of updating budgets

The 1978 consumption budgets were estimated by applying price changes for individual areas between autumn 1977 and autumn 1978, as reported in the Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI-W), to the appropriate autumn 1977 budget costs for each main class of goods and services. The budgets have been updated by the CPI-W since 1969 when the last direct pricing took place. This method of updating is approximate because the CPI-W reflected spending patterns and prices paid for commodities and services purchased by urban wage earners and clerical workers generally, without regard to their type of family and level of living, and because the updating is done at a relatively aggregated level.

Users should note that the procedures used in updating the budgets to 1978 differ from procedures used previously, because the area sample was changed in January 1978 when the CPI revision program was completed. As a result, individual area price changes between autumn 1977 and autumn 1978 were available for only 25 of the budget areas.

Some data on individual area price changes were available for the remaining 19 budget areas through April/May/June 1978 when the unrevised CPI-W was discontinued. These data, along with price change data for appropriate region and population size classes, were used to update the remaining 19 areas. Thus, these areas were updated with some price data that do not specifically pertain to them.

In line with past revisions of the program, the Bureau of Labor Statistics intends to comprehensively revise the family budget series. A committee of experts has been formed to conduct research and develop approaches to be used in this revision. The number of areas for which budgets will be published in the future will depend upon the resources available, and upon the revision methodology chosen. Users will be informed about the progress of this revision. □

FOOTNOTES

Research Summaries

Seasonal variations in employment and unemployment during 1951–75

MORRIS J. NEWMAN

Each June, thousands of young people enter the labor force, and the levels of employment and unemployment jump markedly from the May figures. In January, large numbers of retail store employees, hired to help out in the Christmas rush, leave employment, and the employment level drops. In the same month, many construction workers are laid off because it is too cold to work outdoors. These three events are examples of labor force seasonality—annual events that affect the levels and rates of employment and unemployment.

Much of the data published by the Bureau of Labor Statistics is "seasonally adjusted," that is, estimates of the approximate level of the seasonal variations that usually occur from one month to the next are identified and distributed over the course of a year. This adjustment allows analysts to focus on changes in the data that may have resulted from economic and other nonseasonal forces. Without such adjustments, short-term movements in labor force series due to changes in underlying economic conditions would be far more difficult to discern, because seasonal variations account for an overwhelming proportion of the month-to-month changes in labor force data. For example, usually more than 90 percent of the monthly variation in the level of unemployment results from seasonal conditions.[1]

Economists have frequently identified three major types of unemployment: *cyclical,* caused by business cycle downturns or recessions; *frictional,* the result of voluntary job changes, entrances into and exits from the labor force, and industrial movements; and *structural,* an imbalance caused when jobseekers lack the skills required for available jobs. Some argue that there is a fourth type—*seasonal* unemployment—while others see seasonality as an aspect of the other three types. Whatever the preference, seasonality is an important and often significant part of the unemployment picture. Thus, although most labor force data are adjusted to remove the effects of seasonality, seasonal variations should be studied. A worker who is laid off because of a cold winter is just as unemployed as a worker who is a victim of recession.[2]

This article provides an analysis of labor force "seasonality." Using monthly Current Population Survey data from 1951 to 1975, disaggregated by sex and age, the article describes the variations in patterns of seasonal factors of employment and unemployment among various population (age/sex) groups and examines the changes in these patterns which have occurred over the 25-year period.[3] These seasonal factors are used to adjust original monthly data to produce seasonally adjusted series of employment and unemployment. Seasonally adjusted data are constructed by dividing a given month's actual data by the seasonal factor for that month. For example, if actual employment is 10,000 persons and the seasonal factor is 0.95, the seasonally adjusted employment estimate would be 10,526 persons. Over the course of the year, seasonal factors average 1.0, with factors greater than 1.0 indicating months of seasonally induced high employment and factors less than 1.0 indicating seasonally induced employment lows.

This method is called "multiplicative" seasonal adjustment. An alternative is "additive" adjustment, where the adjustment factor represents the number of persons added or substracted from the original data to yield the seasonally adjusted level. In the above example, the additive factor would be +526. Additive adjustment is usually preferred for adjusting data for groups in which more or less set numbers of individuals move into, or out of, the labor force in response to seasonal conditions. For example, a relatively constant number of teenagers enter the labor force at the end of the school year.

The data presented in this article are "de facto" multiplicative factors: factors derived by dividing the actual level of a statistic by its seasonally adjusted level (whether derived through additive or multiplicative adjustment). This, in effect, recreates multiplicative factors and converts additive factors into a multiplicative form.[4]

Morris J. Newman is an economist formerly in the Office of Current Employment Analysis, Bureau of Labor Statistics.

Teenagers: the school years

Teenagers exhibit stronger, and somewhat different, seasonal patterns than do adults. These differences are caused primarily by the effect of the school year on teenage employment availability. Further, lack of labor force experience means that young people are more likely to have jobs that are less stable seasonally, and they are therefore usually the first to be laid off because of seasonal slowdowns.

The timing of the school year was the dominant event influencing teenage unemployment seasonality during 1951–75. In each year, peak unemployment occurred in June, as the closing of schools for summer vacation enabled many teenagers to seek work. However, there was a shift in the timing of the seasonal low. Prior to 1967, the low occurred in October; beginning in 1967, the yearly low shifted to May, accompanied by a concurrent change in magnitude in the unemployment peak. These developments resulted directly from a definitional change in unemployment made in 1967.[5] Between 1967 and 1975, the seasonality of teenage unemployment declined, the peak June factor dropping from 1.7 to 1.3 and the May low increasing from 0.74 to 0.86. (The movement of factors toward 1.0 indicates declining seasonality.) Chart 1 shows the patterns of seasonal factors for 1951, 1967, and 1975.

Among male teens, employment seasonality was consistently dominated by a July peak and a January low. The July peak was caused by the employment surge during summer vacation. August, another vacation month, was consistently the second highest month of employment for male teens. Further, many of the jobs in which young people are employed, such as landscaping, housepainting, and other maintenance work, are most prevalent in the summer months. Conversely, the January employment low occurs when students return to school after the Christmas-New Year's break and employment levels are typically at a low ebb.

Employment seasonality for female teenagers, while influenced by the same school-related conditions as male teens, displayed a somewhat different pattern. Again the dominant peak seasonality occurred in July, with August the second highest month. However, after a sharp drop in September, employment increased somewhat in October and November, reaching a secondary peak in December, a likely result of retail store hiring for the Christmas buying season. A similar trend did not occur among male teenagers. As with their male counterparts, the winter months—except for December—were the time of lowest employment among these young women.

The seasonal patterns of teenage employment and unemployment were not mirror images, that is, months of peak employment seasonality were not necessarily months of trough unemployment seasonality. This results because some seasonal occurrences affect employment and unemployment levels in a similar way. For example, when school closes for summer vacation, many students have already found jobs, pushing up the employment level immediately. Others enter the labor force unemployed, but soon find work, pushing the employment level still higher in July and August. Further, because of this summer labor force surge, unemployment remains relatively high through July and August as some fail to find jobs and others experience short spells of unemployment between jobs.

Young adults: in transition

The years between age 20 and 25 are often a period of transition from school and adolescence to the world of work and adulthood.[6] Therefore, patterns of seasonality in young adult employment and unemployment are comparable in some instances to those of adults and in others to those of teenagers.

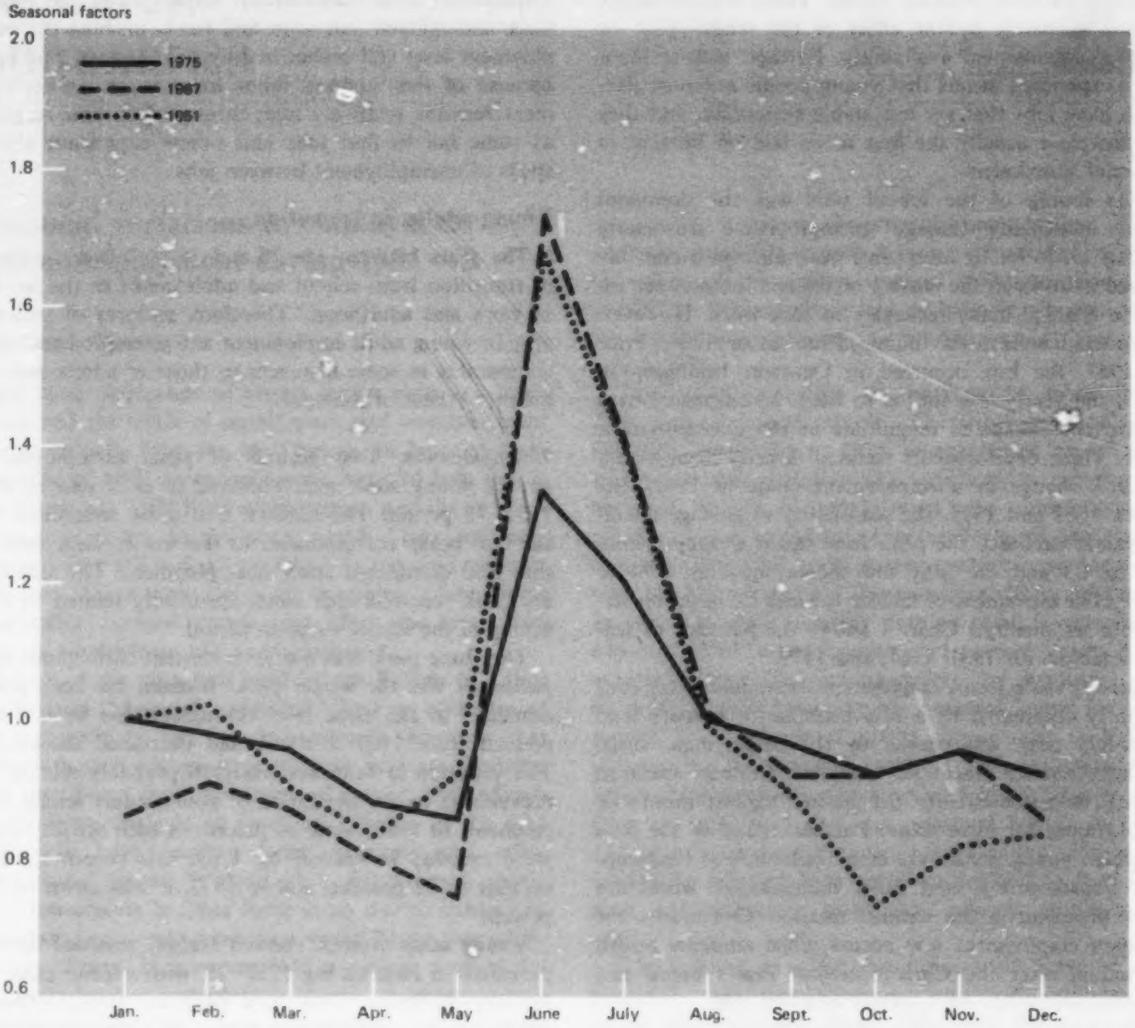
Unemployment. Two periods of peak unemployment among young adult men occurred in each year of the 1951–75 period. The highest, and most consistent, of the two peaks corresponded to the winter slack period that also dominated adult unemployment. The secondary peak recurred each June, apparently related to the timing of the school vacation period.

This June peak was not as consistent throughout the period as was the winter peak. Instead, the June peak remained at the same level throughout the 1950's, increased from 1960 to 1967, and decreased thereafter. The variation in June seasonality is probably related to movements in the likelihood of young adult school enrollment. In 1960, some 20 percent of men age 20 to 24 were enrolled in school; by 1969, this percentage increased to 32 percent, and in 1975, it was down to 26 percent.[7]

Young adult women showed highest seasonal unemployment in June during 1958–75, with a lower peak in January–February. This June peak for young women differed from that of young men in several respects. Women had June increases in unemployment seasonality from 1951 to 1967 and decreases thereafter. However, the change in the magnitude of these factors for young women was far more gradual than for young men. Among the women, the relationship between June unemployment seasonality and school enrollment is not as clear as it apparently is among men: despite their June unemployment peak, women in this age group were considerably *less* likely than men to have been enrolled in school throughout the period. Further, despite the *decrease* in June unemployment seasonality among women from 1967–75, the incidence of school enrollment among young women *increased* throughout the period, not tapering off as it had among young men from 1968 to 1975.[8]

These apparently anomalous seasonality movements

Chart 1. Seasonality of unemployment among teenagers, 1951, 1967, and 1975



in June among young adults probably resulted in part from different responses to winter-induced seasonality. Seasonality in the context of this analysis relates all the months in the year to each other. Therefore, if January–February high unemployment does not affect young women as much as it does young men, the remaining period of high unemployment (June) would be relatively more important among women.

Divergent occupational distributions between men and women in this age group may be central to their differential seasonal patterns of unemployment. Employed young men are much more heavily concentrated in occupations that have high winter unemployment than are women (61 versus 15 percent in 1975).[9]

Employment. Young adult men showed much stronger, yet more stable, employment seasonality than women. Peak employment for these men occurred in July or August. Lowest employment in each year occurred in the January–February period. The timing of the peaks and valleys was similar to that for teenagers, although the magnitude of the seasonal variation was far less. There were no strong changes in the magnitude of seasonality, nor were any secondary employment peaks or troughs apparent.

Young adult women had very different employment seasonality than men. First, the magnitude of the seasonal variation was much less, probably due to their relatively low school enrollment and high concentration in service and clerical occupations, which have stable seasonality. Second, there were two peak periods of employment: prior to 1973, the dominant months of high employment were from October to December, a likely result of the Christmas buying season; while, in 1961, a secondary employment peak developed in the month of August, probably because of school enrollment. As school enrollment grew among this population, from about 8 percent in 1961 to nearly 19 percent in 1975,[10] the August employment peak gained importance, surpassing the December peak in 1973.

Patterns of low employment among young adult women shifted considerably over the period studied. The winter months had the lowest seasonal employment from 1951 to 1967. The dominant low then shifted to September (when school starts) until 1971, when it moved to May (just before school ends). In 1974, low employment among these women returned to February.

Adult patterns: moderation

Adults exhibited patterns of seasonality distinctly different from youth in several respects. First, the timing of the school year had almost no effect on the employment or unemployment of adult men, although a major effect on women age 25 to 44 was apparent. Second, the magnitude of seasonality was much less among adults because of their longer seniority and their greater need in many cases for stable "breadwinning" jobs. There are also major differences between the seasonality of adult men and adult women.

Unemployment. Men age 25 and over had very stable unemployment seasonality, both in magnitude and timing, throughout the 1951–75 period. In each year, peak unemployment occurred in February, while low unemployment occurred in October or September. A slight decrease in the magnitude of seasonality occurred in 1967, probably resulting from the change in the definition of unemployment that occurred in that year. (See footnote 5.)

Unemployment seasonality of adult men in 10-year age groups over age 25 varied only slightly. Among women, however, there was an important variation between those age 35 to 44, who had unemployment seasonality patterns similar to those age 25 to 34, and women age 45 to 54, whose patterns were similar to those age 55 and over.

As with younger women, unemployment seasonality among those in each age group over 25 was less strong and more complex than that for men of the same ages. Each year during 1951–75, women age 35 to 44 had more than 1 month of both peak and low unemployment. From 1951 to 1966, unemployment was highest in the winter. However, there were 2 other months in which unemployment peaked as well. During 1951–66, a peak occurred in November. This peak abruptly disappeared in 1967; undoubtedly, the 1967 definitional change which made work availability a necessary precondition for unemployment, resulted in its demise.[11] The other peak period of unemployment was August–September.

The August–September peak grew steadily in importance from 1951 until 1967, when it became the period of highest unemployment for women age 35 to 44. This peak in unemployment was probably caused by the combination of September's opening of schools and the dramatic increases in labor force participation among married women with school-age children. The labor force participation rate of these women, 30.3 percent in April 1951, increased to 45.0 percent by March 1967 and 52.3 percent by March 1975.[12] It is quite likely that many left the workforce in the summer months when their children were at home and then returned in September when schools opened. This would also explain why the unemployment peak for them shifted from August to September in 1967, as it is likely that these women began searching in August for work to begin in September. (See footnote 5.) Unemployment among women age 35 to 44 was lowest in December, perhaps because of Christmas hiring, and in May, the month before school closes.

Women age 45 to 54 also had a September unemployment peak that emerged in 1967 but never became dominant over the prevailing January–February peak. The relative lack of strength of the September unemployment peak was probably because the children of women in this age group are older than those of younger women and do not need the degree of parental attention that younger children require. From 1951 to 1957, unemployment among these women was at its lowest in October, while, from 1958 to 1970, December was the low month. From 1971 to 1975, however, June was the month when their unemployment seasonality reached a low point.

Employment. Among men 25 or over, employment seasonality was very slight. In 1975, for example, peak seasonality for this group was 1.01 (October), and low seasonality was 0.99 (January–February). In comparison, men age 20 to 24 had peak seasonality of 1.07 and low of 0.95, while teenage males had a range of from 1.31 to 0.87. Peak seasonality among men 25 or over consistently occurred in September or October, while low seasonality occurred in January–February.

Employment seasonality among women age 25 or over was slightly greater than among men, in contrast to the situation for teenagers and those age 20 to 24, where women had less overall seasonality than men of the same ages. Peak employment seasonality occurred among women in October or November, with a lesser peak in May during 1951–66.

Although lowest employment for adult women initially occurred in January, the months with lowest employment were July and August from 1961 to 1975. This movement is probably related to the effects of the school year discussed earlier.

EMPLOYMENT AND UNEMPLOYMENT seasonality are dominated by the effects of winter and the timing of the school year. Young people have more seasonality than older workers, primarily because their availability for work is strongly tempered by the demands of school. During 1951–75, with the exception of employment seasonality among those over age 25, there was a greater magnitude between seasonal peaks and troughs among men than women. Women, however, were subject to more shifts in patterns of employment and unemployment seasonality than were men, both in the number of peaks and troughs in a given year and in the timing of the dominant seasonal highs and lows over the 25-year period. There was little evidence of any significant change in the magnitude of either employment or unemployment seasonality, with the exception of some decline among teenagers. □

FOOTNOTES

[1] Although seasonal adjustment of labor force data is necessary to isolate the effects on nonseasonal forces, seasonally adjusted data are subject to greater error than original data due to uncertainties in the seasonal adjustment process.

[2] See *The Economic Report of the President, February 1975*, for a discussion on the four types of unemployment.

[3] The January 1951 and December 1975 starting-ending dates for this analysis were chosen because they are, respectively, 3 years from January 1948, when monthly disaggregation of comparable CPS data by age and sex began, and 3 years from December 1978, when the data for this study were organized. The first and last 3 years of data are excluded because seasonal factors are computed from original series data on a weighted moving average basis, 3 years forward and 3 years back in time.

[4] See *The X-11 Variant of the Census Method II Seasonal Adjustment Program* (Washington, D.C., Bureau of Economic Analysis, November 1976, and U.S. Department of Commerce, National Technical Information Service, No. PB-261 432).

[5] Prior to 1967, persons were classified as unemployed if they had not worked during the survey reference week (the week containing the 12th day of the month) and had been actively seeking work. Since 1967, however, a 4-week search period was introduced (instead of an implied "last week"), and jobless persons also had to be *available* for work during the reference week to be classified unemployed. Therefore, many students who were seeking summer work in April, May, or June prior to the end of the school year were no longer measured as unemployed in those months. This caused unemployment to drop sharply in April and May and to a lesser extent in June, because many schools had not closed by the week of the 12th of June. Conversely, this definition change caused unemployment in the other 9 months of the year to rise relative to April, May, and June.

[7] See *Employment and Training Report of the President 1978* (Washington, Employment and Training Administration, 1978), table B–6.

[8] Ibid.

[9] Occupations with consistently high winter unemployment seasonality include managers and administrators except farm, craft and kindred, operatives except transport, transport equipment operatives, and nonfarm laborers.

[10] See *Employment and Training*, table B–6.

[11] The end of the November unemployment peak did not result from a decline in the November seasonal factor (from 1.04 in 1966 to 1.05 in 1967). Rather, it was caused by 1966–67 declines in January (1.10 to 1.06), February (1.13 to 1.09), April (0.97 to 0.94), and December (0.88 to 0.85), which in turn resulted in increases in September (1.09 to 1.17) and October (0.98 to 1.07). Therefore, November became part of a steady decline from August–September highs to December's low seasonal unemployment.

[12] See tables B–2 and B–4 of *Employment and Training Report of the President 1978*. It should be noted that the labor force participation rates cited in the text of this article for women with children are for all women with children age 6 to 17. However, the participation rates for women age 35 to 44 who were married with spouse present were nearly identical to those for all women with children age 6 to 17, 30.5 percent in April 1951, 42.7 percent in March 1967, and 52.1 percent in March 1975. Further, among single women in this age group, participation actually declined slightly, from 81.7 percent in April 1951 to 78.1 percent in March 1975. Among those who were widowed, separated, or divorced, participation was essentially unchanged, 69.0 in April 1951 and 69.5 in March 1975.

Individual hourly earnings in men's apparel, 1978

Individual hourly earnings in men's shirts and separate trousers manufacturing ranged from $2.65 (the Federal minimum wage at that time) to $5 or more in May 1978. Bureau of Labor Statistics surveys show that, excluding the upper and lower fourths of the workers in the industries' earnings arrays, the range for the remaining middle half of the distribution was still relatively large—a spread of $1 an hour—for these low-paying industries. About four-fifths of the production and related workers employed in the shirts (85,000) and trousers (55,000) industries were under individual piece rate systems.

Substantial proportions of shirt and trousers workers were at or hovered near the Federal minimum wage—about one-fifth in spring 1978. Subsequently, the hourly pay levels for shirts ($3.28) and for trousers ($3.46) were about 60 percent below the all-manufacturing figures. Worker attachment to the Federal minimum wage for these industries in 1978, however, was only half that of 10 years earlier.[1] Sewing machine operators, a relatively low-paying occupational group, continue to be a majority of each industry's production work force.

Highlights of other survey findings followed patterns found in most American industries under study by the Bureau. As illustrated in table 1, workers in metropolitan areas averaged higher earnings than those in the smaller communities, worker's earnings in the larger mills outgained those in the smaller plants, and the average earnings of union workers exceeded the pay rates of employees in nonunion plants. Establishments operating under labor-management agreements employed nearly three-tenths of the shirt workers and slightly under four-tenths of the separate trousers work force. The Southeast was the principal region in both industries.

Approximately nine-tenths of the shirts and separate trousers production workers were provided paid holidays, paid vacations (after qualifying years of service), and life, hospitalization and surgical insurance plans. Also granted to at least six-tenths of both worker groups were accidental death and dismemberment plans, and major medical coverage. One-half of the shirt workers and about three-fifths in trouser factories were provided pension plans, most of which were financed entirely by the employer.

Table 1. Average straight-time hourly earnings[1] of production and related workers in men's and boy's shirts and separate trousers manufacturing establishments, May 1978

Characteristic	Men's and boy's shirts		Men's and boy's trousers	
	United States[2]	Southeast	United States[2]	Southeast
All production workers	$3.28	$3.20	$3.46	$3.40
Men	3.72	3.67	3.93	3.79
Women	3.24	3.15	3.41	3.35
Size of community:				
Metropolitan areas[3]	3.43	3.28	3.62	3.52
Nonmetropolitan areas	3.23	3.18	3.40	3.38
Size of establishment:				
Under 250 workers[4]	3.20	3.05	3.39	3.27
250 workers or more	3.37	3.31	3.51	3.55
Labor management contract coverage establishments with:				
Majority of workers covered	3.65	3.54	3.72	3.72
None or minority of workers covered	3.14	3.13	3.30	3.34
Selected occupations[5]				
Adjusters and repairers, sewing machine	4.98	4.99	4.96	4.82
Cutters, cloth, machine	4.36	4.22	4.58	4.57
Garment repairers	3.10	3.01	3.24	3.09
Inspectors, final	3.13	3.03	3.48	3.51
Janitors	2.97	2.91	3.03	2.98
Markers	4.10	3.86	3.90	3.87
Pressers, finish, machine	3.66	3.38	3.81	3.68
Sewing machine operators	3.23	3.14	3.41	3.36
Shipping clerks	3.70	3.66	3.73	3.64
Spreaders	3.49	3.40	3.90	4.00
Thread trimmers	3.35	2.95	3.46	3.51
Work distributors	3.06	2.96	3.27	3.22

[1] Excludes premium pay for overtime and for work on weekends, holidays, and late shifts.

[2] Includes data for regions in addition to those shown separately. The comprehensive bulletin provides data for regions in addition to Southeast.

Survey coverage nationwide in separate trousers industry reflected only 88 percent of the workers in firms classified in the industry because of few large firms did not furnish data and could not be adequately represented by others visited.

[3] Standard Metropolitan Statistical Areas as defined by the U.S. Office of Management and Budget through February 1974.

[4] The minimum size plant within scope of the survey was 20 workers in shirts nonmanufacturing and 50 workers for separate trousers.

[5] The comprehensive bulletin on the surveys provides data for occupations in addition to those presented below.

The comprehensive report on both surveys (*Industry Wage Survey: Men's Shirts and Separate Trousers, May 1978, Bulletin 2035*), as well as a national and regional summary for each industry, and separate releases for 13 areas of concentration for shirt manufacturing and 8 localities for men's separate trousers, may be obtained from the Bureau or its regional offices.

Cost-of-living indexes for Americans living abroad

The U.S. Department of State has prepared new indexes of living costs abroad for Americans in Buenos Aires, Hong Kong, New Delhi, and Stockholm. The new indexes are 4 percent higher for Buenos Aires, essentially unchanged for Stockholm, and 4 and 7 percent lower than the previous indexes for New Delhi and Hong Kong. (See table 1.) The periods between survey dates were 4 months for Buenos Aires, 13–14 months for Hong Kong and Stockholm, and 22 months for New Delhi.

The new indexes for Buenos Aires and New Delhi were computed using new expenditure weights derived from the 1972–73 Bureau of Labor Statistics Consumer Expenditure Survey data for Washington, D.C. The new weights are being used to compute all indexes based on retail price surveys dated July 1979 and later. For Buenos Aires and New Delhi, the new weights do not make a significant difference in the local index levels. For Americans in Buenos Aires, average prices were up 20 percent more than in Washington, D.C., between surveys, but the peso depreciated 16 percent against the dollar and offset most of the relative price rise. For Americans in New Delhi, however, average prices in the new survey were up 10 percent less than in Washington, D.C., but the rupee appreciated 6 percent relative to the dollar.

For Americans in Stockholm also, a 5-percent appreciation of the krona against the dollar offset a decline in relative prices in national currency. The 8-percent depreciation of the H.K. dollar relative to the U.S. dollar accounts for the decline in the local index for Hong Kong, as prices paid by Americans rose at the same rate as in Washington, D.C.

Because currency exchange rates are subject to sudden shifts, it is advisable to check the prevailing rates whenever using the indexes of living costs abroad. The indexes for these and all other reporting cities are

Table 1. Indexes of living costs abroad, excluding housing and education, November 1979

[Washington, D.C. = 100]

Country and city	Survey date	Monetary unit	Rate of exchange per US $1	Local index

published in quarterly reports entitled U.S. Department of State Indexes of Living Costs Abroad and Quarters Allowances, available on request from the Office of Publications, Bureau of Labor Statistics. ☐

Printers' wage increases lowest in 4 years

Union wage rate increases for the printing trades spanning July 1976–77 were the smallest since 1972–73, according to a Bureau of Labor Statistics survey of unions in large cities.[1] The average advance for printing trade members was 6.6 percent, compared with 6.9 percent in mid-1975–76. (See table 1.)

Between July 1976 and July 1977, wage rates increased by 7.0 percent in book and job shops, 6.2 percent in newspaper plants, and 6.6 percent in lithography shops. Wage rates increased for nearly all of the union membership covered by the survey: 92 percent of union workers in book and job shops received increases, 80 percent of those in newspaper plants, and 99 percent in lithography shops.

The average wage rate for union workers was $8.46 an hour on July 1, 1977. By industry, averages were $7.91 for book and job shops; $8.74 for newspaper plants ($8.48 for day shifts and $9.01 for night shifts); and $9.26 for commercial lithography shops. Occupational averages in book and job shops ranged from $5.42 for bindery workers to $9.69 for photoengravers. Average daywork rates in newspaper plants ranged from $8.24 for mailers to $9.22 for photoengravers. In commercial lithography shops, the lowest average was for press assistants and feeders ($8.23), and the highest for lithographic artists ($9.76), which was also the highest day-shift average for the survey as a whole.

Table 1. Union wage rates for printing trades, annual percent changes and indexes, July 1967 to July 1977

[1967 = 100]

Year	Percent change	Index
1967	4.1	100.0
1968	5.0	105.0
1969	6.6	111.9
1970	8.3	121.1
1971	10.2	133.6
1972	8.0	144.2
1973	6.3	153.3
1974	8.1	165.7
1975	8.5	179.8
1976	6.9	192.2
1977	6.6	204.9

Regionally, the printing trades pay spread was 33 percent, with the Middle Atlantic States having the highest wage levels and the Southeast and Southwest, the lowest. Although less important than location, city population size also seemed to be related to wage levels. For example, wage rates in cities of at least one million inhabitants averaged $9.27—11 percent more than those in cities of 500,000 to 1 million ($8.32); 15 percent more than those in cities of 250,000 to 500,000 ($8.09); and 23 percent more than those in cities of 100,000 to 250,000 ($7.52).

Individual city listings and a summary of nationwide results of the survey are available from the Bureau or its regional offices. A comprehensive bulletin, providing more detailed information on wage rates and employer benefit fund payments, is in preparation. ☐

——*FOOTNOTE*——

[1] The survey of printing trades was designed to reflect union wage rates in the 153 cities having 100,000 inhabitants or more, based on the 1970 Census of Population. Data for the 66 cities studied were obtained from local union officials through mail questionnaire, telephone, or personal interview. Union wage rates are the basic (minimum) wage rates (excluding holiday, vacation, or other benefit payments made or regularly credited to the employee) agreed upon through collective bargaining. Overtime pay for hours beyond the established daily and weekly maximums is also excluded. Averages do not reflect rates for apprentices or premium rates, except for nightwork in newspaper plants. Thus, the averages do not represent total hourly earnings of organized printing trades members.

Major Agreements Expiring Next Month

This list of collective bargaining agreements expiring in February is based on contracts on file in the Bureau's Office of Wages and Industrial Relations. The list includes agreements covering 1,000 workers or more.

Employer and location	Industry	Union[1]	Number of workers
A. O. Smith Corp. (Granite City, Ill.)	Transportation equipment	Auto Workers (Ind.)	1,850

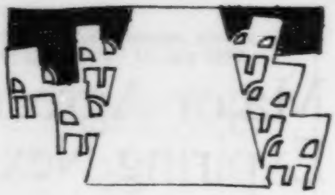
Developments in Industrial Relations



Newport News shipyard recognizes Steelworkers

Newport News Shipbuilding and Dry Dock Co. acquiesced to a Federal circuit court of appeals ruling and recognized the Steelworkers union as bargaining representative for its 15,500 production and maintenance employees. Company President Edward J. Campbell said that a contract would be negotiated "as soon as practicable."

Steelworkers' officials hailed the representation victory at Virginia's largest private employer as a breakthrough in their efforts to organize workers in the South.

The dispute began in 1978, when the Steelworkers opposed the Peninsula Shipbuilders Association, a company union, in a National Labor Relations Board election at the yard. The vote was 9,093 to 7,548 in favor of the Steelworkers. The Board certified the results but the company appealed the decision, contending irregularities in the balloting. A district judge ordered the Board to reconsider its decision. After hearings, the Board decided the voting irregularities were not sufficiently widespread to affect the election results. The company appealed this decision to the circuit court of appeals, which issued the final ruling in the case.

The Steelworkers had begun a strike against the yard in January 1979, in an effort to force negotiations. The strike was suspended in April because many employees had returned to work.

Union wins access, vote at J. P. Stevens plants

The Amalgamated Clothing and Textile Workers' 16-year attempt to organize employees of J. P. Stevens & Co. was aided by a National Labor Relations Board ruling that the company allow union organizers access to its plants and the winning of a representation election in the South.

The Board ordered J. P. Stevens to grant ACTWU organizers access to its plants during the next 2 years. The Board ruled that the company had repeatedly violated the National Labor Relations Act and had ignored remedial orders of the Board and, on occasion, of Federal courts. Accordingly, the panel declared that "the imposition of extraordinary remedies" sought by the union was justified.

This ruling resulted from a 1976 organizing campaign at Stevens' Angle and Ferrum plants in Rocky Mount, Va., during which the union charged the company with violations of labor laws. In 1978, an administrative law judge ordered Stevens to reinstate a worker allegedly fired for union activity and to stop threatening other workers who engage in union activity. This current ruling broadened the judge's remedies to include that (1) on request, Stevens furnish the union with a list of all its workers and their addresses, (2) ACTWU officials be given access to company bulletin boards and allowed to address workers in all plants, and (3) in the event of a National Labor Relations Board election at any Stevens facility, the company permit at least two union officials to enter the plant to deliver a 30-minute speech to employees during working time.

The tally at the representation election at a Stevens plant in High Point, N.C., was 68 votes for the ACTWU and 48 for "no union." The win, the union's second at Stevens in the 16-year-period, came despite union claims of unlawful tactics by Stevens. The first victory was in 1978 at a Stevens plant in Roanoke Rapids, N.C., but an initial contract has not yet been negotiated.

Stock payment plan established for meatpackers

The round of bargaining between a number of major meatpackers and the Food and Commercial Workers concluded when Rath Packing Co. settled. Unlike the earlier accords which followed the pattern established by the John Morrell & Co. settlement (*Monthly Labor Review*, October 1979, p. 72), the Rath agreement provided for a stock-wage payment plan.

Under the plan, the 1,800 workers will receive the same hourly wage increases as those at the other companies, but they will receive part of their weekly earnings in Rath common stock until a total of 1.8 million shares has been distributed. Employees will receive at least $20 of their weekly earnings in cash and stock that will be deposited in individual accounts. The initial split will be $4 in cash and eight shares of stock at a fixed price of $2 a share.

UMW, mine operators sign safety pledge

The Bituminous Coal Operators Association and the United Mine Workers signed a pledge to cooperate in improving health and safety conditions in the mines. The pledge was in the form of a memorandum to Governor John D. Rockefeller of West Virginia, chairman of a commission appointed by President Carter to recommend changes to improve collective bargaining approaches, health and safety conditions, and productivity in the coal industry. The memorandum was written by a union-industry-government mine safety study group, which included representatives of the Mine Safety and Health Administration of the U.S. Department of Labor.

The agreement commits members of the BCOA to work through the joint study group for improved "mandatory health and safety standards based on factually justified needs." This includes close cooperation with the agencies responsible for formulating regulations to protect mine workers.

Despite this indication of improved cooperation between the UMW and the BCOA, there was another development that may have an adverse impact on future bargaining in the industry. The Consolidated Coal Co., the Nation's second largest producer, withdrew from the BCOA and announced that it would bargain separately with the union. There also was a possibility of further withdrawals; talks were reportedly underway within the BCOA on a demand by member steel companies that they be given a greater role in negotiations with the UMW.

The BCOA member companies are centered in the Appalachian region and produce about half of the Nation's soft coal, usually in underground mines.

Income taxes urged for funding social security

The controversy over the current and future condition of the social security system was renewed when the Advisory Council on Social Security presented its recommendations to Congress. One of the major recommendations of the Council was that part of the system be funded from income taxes, rather than from payroll taxes. According to the Council, this would reduce the present 6.13-percent payroll tax rate for both employees and their employers to 5.6 percent this year and preclude the need for any future increase until the year 2000.

In a 400-page report, the 13-member panel made up of academic experts and representatives from labor, government, and business recommended:

- Phasing into the system all employees of government and nonprofit organizations.
- Reducing slightly the maximum portion of workers' wages subject to payroll tax. (Effective January 1, 1980, the 6.13-percent tax applied to the first $25,900 of annual earnings.)
- Improving benefits for divorced women, widows, and workers at the low and high end of the wage range.
- Increasing the age at which a person is eligible for maximum social security retirement benefits from 65 to 68.
- Strengthening the benefit funds during periods of high unemployment by diverting money from general revenues.
- Subjecting half of all social security benefits to income taxes.

The Council found the current system financially sound, stating that the present low levels of funds are temporary and have "little bearing on the long-run financial strength" of the system.

A panel is appointed every 4 years to assess the social security system. The current Council was headed by Henry Aaron of the Brookings Institution.

Initial contract for Southern furniture workers

The AFL-CIO's Industrial Union Department, which for 2 years has been coordinating a drive to organize Southern furniture plants, announced that the United Furniture Workers of America has negotiated an initial contract with the Phoenix Chair Division of Thomasville Furniture Industries. The accord covered 500 workers in West Jefferson, N.C.

The IUD organizing director Harold McIver called the settlement a major breakthrough which will spur efforts to organize other Thomasville Furniture plants, as well as other furniture companies in the South. He said that Thomasville Furniture employs a total of 5,000 workers at 21 plants in North Carolina and Virginia.

The 1-year contract provides for a 9.5-percent wage increase, an additional paid holiday, and improvements in pension and health benefits.

Recording musicians approve new contract

American Federation of Musicians (AFM) members ratified a 25-month contract with the recording industry that provided for an 8-percent increase in wage scales, retroactive to November 1, and a 7-percent increase in November 1980. After the November 1980 increase, musicians' rates will be $146.81 for a basic 3-hour commercial session and $96.90 for a 1-1/2 hour session. For symphonic sessions, the new scales will be $115.62 for 3 hours and $207.49 for 4 hours.

AFM President Victor W. Fuentealba said that the union also gained provisions setting terms and conditions for recording chamber music and a new formula for "on location" recording of symphony and opera music. According to Fuentealba, these new provisions will improve employment opportunities for AFM members in the United States and Canada and eventually reduce the "flood of foreign recordings in the classical musical field."

The contract was approved by a 1,550 to 240 vote in a mail referendum. About 6,200 AFM members who earned at least $1,000 from phonograph recording in 1978 were eligible to vote.

More settlements in electrical equipment industry

The International Brotherhood of Electrical Workers and the International Union of Electrical Workers settled with RCA Corp., on terms that union sources said were similar to the General Electric Co. settlements that led off the round of bargaining in the electrical equipment industry (see *Monthly Labor Review*, September 1979, p. 61). The RCA accords were negotiated 2 weeks before the expiration date of existing contracts and covered 13,000 workers represented by the IBEW and 6,000 workers represented by IUE. The IBEW agreement is for 3 years and the IUE agreement is for 4 years, with a provision for reopening wage bargaining after the third year.

Wage provisions of the IBEW contract included increases of 12 cents an hour in the first year, 17.5 cents in the second, and 15 cents in the third. In addition, employees received an immediate cost-of-living increase of 38 cents an hour, and they will receive future automatic semiannual adjustments at the rate of 1 cent for each 0.2-percent movement in the Consumer Price Index. (The previous contract provided for annual adjustments of 1 cent for each 0.3-percent movement in the CPI, with no credit for that portion of any rise between 7 and 9 percent in a year.)

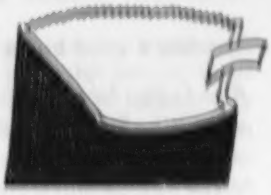
A major insurance improvement was the adoption of a company-financed dental plan for employees and dependents, effective January 1, 1981. The plan provides full coverage of usual and customary fees for diagnostic and preventive procedures and 50 percent coverage for restorative services, up to a maximum annual benefit of $750 per person. Other insurance improvements included $400,000 lifetime major medical coverage per disability (formerly $100,000); full payment of all family hospital-medical costs in excess of $1,000 a year; full payment for a second surgical opinion; maximum $200 a week sickness and accident benefits (formerly $175); and additional optional life insurance for dependents, financed by the employee.

The employee's share of the cost of the pension plan was reduced to 3 percent of that portion of annual earnings in excess of $9,000 (formerly $6,600). Minimum pension rates were increased to a range of $10 to $16 a month for each year of credited service, compared with $10 to $15 at General Electric. □

A note on communications

The *Monthly Labor Review* welcomes communications that supplement, challenge, or expand on research published in its pages. To be considered for publication, communications should be factual and analytical, not polemical in tone. Communications should be addressed to the Editor-in-Chief, *Monthly Labor Review*, Bureau of Labor Statistics, U.S. Department of Labor, Washington, D.C. 20212.

Book Reviews



People and jobs—taking the long view

Local Population and Employment Projection Techniques. By Michael R. Greenberg, Donald A. Kruekeberg, Connie O. Michaelson with Richard Mautner and Nancy Neuman. New Brunswick, N.J., The Center for Urban Policy Research, 1978. 277 pp.

The purpose of this monograph is to present and analyze models for the projection of population for minor civil divisions for up to 50 years and employment of counties for up to 25 years. Each set of models is introduced by a very clear, concise discussion of the usefulness and limitations of the variety of models currently available for projections.

Three classes of models for the projection of the population of minor civil divisions are given. As the authors explain, the simplest model is an extrapolation of the trend of historical growth rates; the second is based on distributional properties of projections made by regional or county agencies; the third increases or decreases populations on the basis of density limits. The monograph provides a thorough explanation of the population models described, including a summary based on empirical tests and informed judgments which examine the time or spatial appropriateness of each projection method. Both component, for example, cohort-survival and composite, and noncomponent, for example, trend extrapolation and housing unit methods, are analyzed.

The summary, along with the concise discussion which accompanies each method, is an excellent starting point for students of population projection methods. It also serves as a good review for those who have become "attached" to a particular methodology which may no longer fit the changing population trends of their area—or those who have accepted and long since forgotten the limitations inherent in a given method.

The discussion is followed by chapters describing the job set up and a listing of the input deck for a sample program. Because the boundaries of minor political units are frequently artificial, and thus inappropriate for many planning purposes, the authors have included an excellent chapter on allocations of population to other geographic delineations, such as river basins, market areas, and grid zones.

The second section of the monograph begins with an overview of employment projection techniques followed by a description of four models. The models include Constant Share, Simple Linear Regression, Population/Employment, and OBERS. The popularity (or criticisms, depending on one's point of view) of the OBERS projections makes this section extremely helpful.

The complexity and interdependences characteristic of our modern economic system encourage everyone, individuals, business firms, and government agencies to get into the projection ball game, often with disastrous results. There is no argument as to the need for constructive long term planning at the level of each political unit, especially the minor civil divisions. In addition, allocations of moneys from higher to lower political units are a widely used technique designed to accomplish the goal of local participation in current budgeting and expenditure planning. In some cases, funds are available to local units for the research necessary to develop long range programs and plans. However, more often than not, local expertise to carry out the research even with trained personnel may be less than adequate. No book can provide a complete solution to this problem. But for those not thoroughly familiar with projection techniques, as well as for those who need to update their expertise, this book provides an invaluable tool.

Lest one conclude that it is simply a technical manual for population and employment projections, I would reiterate its contribution in the summarization of the available methodology, specifically its emphasis on the appropriateness, complexity, and limitations of each method. The authors make excellent use of references to other more detailed works on projection methodology and empirical testing. Thus, from many standpoints, as a reference book, as a manual of projection models, and as a thorough analysis of methodology, the book serves its reader well.

Landing a good blue-collar job

Blue-Collar Jobs for Women. By Muriel Lederer. New York, E. P. Dutton, 1979. 237 pp. $12.95, cloth; $7.95, paper.

The subtitle on the front cover of *Blue-Collar Jobs for Women,* "A Complete Guide to Getting Skilled and Getting a High-Paying Job in the Trades," is not that far off in its self-description, although it isn't until the final section of the book and the appendix that the author addresses both of these tasks. But *Blue-Collar Jobs for Women,* in spite of its title and like its predecessor, *New Job Opportunities for Women,* published in 1974, is a book not just for women. Rather, it is a book for minorities, the handicapped, and even men, who want to find out about skilled jobs and how to get them. In this regard, the book accomplishes its purpose.

In the first and largest section of the book, however, "Best Bets for Jobs that Pay," Lederer has assembled a compendium of craft and blue-collar job descriptions in a format similar to that of *New Job Opportunities for Women.* For each occupation the book describes in depth what the work entails, necessary training and abilities, potential earnings, and the occupational outlook. Although it appears that Lederer relies on data compiled and published by the Bureau of Labor Statistics, she does not mention the source of her figures nor to which year the salary figures refer.

Lederer also neglects to define clearly what she means by the blue-collar classification. The Bureau of the Census defines blue-collar occupations to include craftworkers (workers in construction and mechanics and repairers), as well as operatives and laborers. This distinction is crucial since it represents the wide skill level and salary range of blue-collar work. In giving salary estimates it perhaps would have been helpful for Lederer to point out that a particularly high figure—that for a skilled carpenter, for example—might refer to a union member in a metropolitan area, but be unrealistic for an unskilled worker in another area. It would be erroneous for women to assume that blue-collar work automatically provides an opportunity to make more money.

In reading this first section, one also wonders to what the ending of the chapter head "Best Bets for Jobs that Pay" refers. Is it money? Opportunity? One assumes it means both. Yet, some of the salary ranges are vast—electroplaters, for example, are quoted as making $2.75 to $9.80 per hour. And some of the openings for jobs, like printing occupations, are very few or declining.

But for the most part, Lederer conveys the job descriptions of the blue-collar occupations in an interesting and timely manner, chiefly by peppering the text with lots of remarks by women working in blue-collar jobs. For example, in her passage describing the plumber's occupation she writes:

> Mary Gardner admits that lady plumbers are rare so far. 'But my hands get between some tight-fitting pipes,' she says, waving a wrench in one hand and a piece of pipe in the other. 'I put a wet bar into a space 2 feet by 2 feet and I could hardly get my own two feet in to run the pipes to the existing kitchen system back-to-back.'

In general, these working women's comments interspersed throughout the text do more than hold the reader's attention. They are particularly illuminating to women interested in following the footsteps of the first successful few, for they give personal insights as to what the jobs are like, in the everyday working atmosphere, the rewards of working in skilled occupations, and what the obstacles were in breaking into the jobs. These passages are realistic. All of the women don't have instant success stories to tell. They have entered the skilled and craft trades in a variety of ways, some with more delays and difficulties than others. But they have entered and succeeded and their comments are testimony to their achievement.

Another passage on the job of the operating engineer repudiates the myth of women's physical incapacity for blue-collar jobs. It reads: "You wouldn't think that Lisa O'Malley, a petite redhead, could move tons of steel everyday in her job, but as a crane operator, that's exactly what she does. It's quite simple to operate a crane, she says. There are three controls for different directions, plus a brake and an alarm to warn people when the load is moving." At another point in the text Lederer makes the comment that men try to put women down for thinking they can excel in blue-collar jobs by telling them, "It's heavy work." Lederer asserts that women should best answer with a reply like, "But so is housework, gardening, nursing, and raising kids."

Besides describing blue-collar and skilled occupations, a big purpose of the book, as described by the subtitle, is explaining how to get into these jobs. Although Lederer begins the mission in the third chapter "Moving Toward Your Job" it is not until the appendix that she makes the forthright statement: "Here are some things you can do to start breaking into a blue-collar program." She suggests some organizations to contact and lists addresses of organizations devoted to women's upward mobility. The appendix of 40 pages is one of the most valuable parts of the book, containing a glossary and information on apprenticeships. Unfortunately, some of the addresses given by Lederer are out of date, undoubtedly a problem related to getting to press her lengthy research efforts.

In yet another respect the book proves valuable. Although the author glamorizes the economic rewards of blue-collar work, she tries not to glamorize other aspects of the occupations. Lederer says, "Are you willing to overlook the disadvantages of the job? Have you looked behind the scenes of what appears to be a glamorous job to see what the disadvantages are?" This may be an important assertion to the audience Lederer is chiefly concerned about, because to many women unknowledgeable about skilled and craft jobs, they may appear overly attractive for any number of reasons.

In the introduction, Lederer reminds us that millions of Rosie the Riveters performed innumerable skilled jobs during World War II. During the period from December 1941 to March 1944, 6.7 million women entered the labor force. Of these, 2.9 million were blue-collar workers. After the war their numbers diminished to the extent that census takers did not even count the remaining female blue-collar workers. In recent times, this has changed. Since 1970, the number of women in blue-collar jobs has almost doubled.

One of the reasons Lederer attributes to the recent increase in female blue-collar workers is economic benefit, and she reiterates this theme throughout the book, both in her own words and in her selection of comments from women workers themselves. But it is a point perhaps overemphasized. Lederer says: "Women are finding out what men have known for a long time: A skilled trade pays twice as much as a traditional women's white-collar job." While no one could argue with the credibility of money as a motivating factor, it is not the total nor necessarily the best explanation. For many women, the right to a skilled or craft job is not merely a matter of equal economic rights, but is a matter of equal rights to a job that will prove enormously satisfying. For some women, as well as for some men, meaning and satisfaction are the prime benefits in using their hands and minds in a skillful and complementary manner. These jobs provide an opportunity to use agility, strength, coordination, intelligence, and mechanical aptitudes, qualities over which men have no exclusive possession. So, the right to blue-collar jobs is not just an economic flight from the pink-collar ghetto. It is the flight for women to satisfying and fulfilling—economic and otherwise—jobs and opportunities.

Alienation in the organization

Life in Organizations: Workplaces as People Experience Them. Edited by Rosabeth Moss Kanter and Barry A. Stein. New York, Basic Books, Inc., Publishers, 1979. 444 pp. $17.50 cloth; $6.95, paper.

"The [organization] is too much with us soon and late, getting and spending we lay waste our powers . . ." seems to be one of this book's major implications which applies to organizational life in either the top or the bottom ranks. Those in the top cadre are typically too exhausted from the struggle to get ahead to understand fully why matters go as they do at the bottom; while those at the bottom devolve into cynicism because they feel they are never taken seriously enough by management to have a genuine effect on their own or their organization's performances. The author-editors through their selections and their contributions have shed much light on the ways that an imperfect human nature confounds and frustrates workers and managers alike in today's bureaucratic-organizational life.

A little more than a century ago, most people dwelt and earned their living in nearly the same physical location—the modest farm, store, workshop, and so on. Now the vast majority work far from their dwellings in large and complex organizations, which has generated an ethos often quite remote from the familiarity, loyalty, and sense of challenge of the earlier period. The gain in overall output and productivity during this transition was enormous; the resultant feelings of irritation and unease, beginning to border on an outright alienation among employees at the bottom, is what this collection seems to point to in the present work force.

Twenty-two selected essays or case studies, four of which are the editors' individual or collaborative work, are presented in two sections. First are those which examine separately top managers, middle managers, and ordinary workers, and, second, more generalized selections. Even through most of the latter, there continues to run a flavor of the officer (top and middle managers) versus enlisted man (worker) confrontation. The editors see in all of this a power struggle going on overtly and covertly at all levels of the modern social entities for producing and servicing which we call organizations.

At the top, power becomes a riddle intimately intertwined with the protagonist's vanity and ego fulfillment. A top manager is given authority or license to exert power, but quickly finds that the exercise of that power is dependent upon the covert sanctions and permissions granted by the follower managers, and that followers make this grant only when the top manager fills their needs or fits their expectations. When this does not occur, the struggle among the combatants drains energy away from the primary task of managing the overall organization.

Those at the bottom also want power, say the editors, but this is a highly localized power over the particular conditions of work of individuals or small groups. Where formal organizational rules successfully oppose worker controls of this nature, power can be exercised negatively by a rapid decline in responsibility for the quality of output or service, or even some forms of sabatoge.

Informal systems, operating around or beneath the formal rules, as described in several of the selections, particularly the Lordstown studies, illustrate how workers take power by controlling the way in which they work, without regard to management rules or collective bargaining agreements.

Much of managerial theory and training focuses on maintaining a flow of communications between managers, especially those in the middle range, and workers at the bottom. But, except in a few cases like the Scanlon Plan or the Lincoln Electric system, there is almost no earnest attempt to tap the common-sense knowledge the imaginative worker builds up over the years at a workplace. Management is most typically too preoccupied in "making it" up the executive ladder to invest the time and energy required. The employees joke that "there's the right way to do the job and the company way," and become increasingly indifferent to the goals of augmented quantity or quality of output. An officer-enlisted man culture persists as the chasm widens between the largely college trained managers and the less formally educated at the bottom. The trained professionals can't or won't accept the thoughts or ideas of those at the bottom, and this is often deeply resented, causing a pervasive dilution of the organization's potential.

In addition to the more common scenes of industrial workplaces, the collected selections here range over such organizations as universities, retail stores, government agencies, editorial offices, and others. The author-editors see this work as a practical book of advice, and there is much good advice and object lessons to be drawn. One case study presents a well-balanced account of participatory management in an insurance organization in which those at the top and at the bottom share control and power in some unique, and sometimes tenuous, ways.

In addition to the selections themselves, the introductory and summarizing commentary of the editors is knowledgeable and thoroughly straightforward, in fact, refreshingly free of the jargon and cliches so often found in this type of book. This is a solid piece of work that deserves to be read by all persons who are curious about, or have a stake in, modern organizations.

—KENNETH G. VAN AUKEN, JR.
Special Assistant to the Commissioner of Labor Statistics

Book notes

American Labor Sourcebook. Compiled by Bernard and Susan Rifkin. New York, McGraw-Hill Book Co., 1979, 928 pp. $39.95.

Anyone who spends $39.95 for this book on the basis of the publisher's claim that it "compiles all the essential information on labor-management negotiations" is likely to be disappointed. A reader with more modest expectations, who wants a lot of information in a single volume, may find it useful.

The 928-page book organizes into 20 sections a wealth of material photographically reproduced from publications of the Bureau of Labor Statistics, other U.S. government agencies, and the AFL-CIO.

The book begins with a review of "Labor in 1977 and 1978," consisting of "Developments in Industrial Relations" sections from 23 issues of the *Monthly Labor Review,* and ends with a selection of labor force and consumer price tables from the *Monthly Labor Review* and other BLS publications. In between, are sections describing the structure of the labor movement, labor and the courts, Federal labor laws and agencies, labor history, unemployment insurance, workers' compensation, other State labor legislation, and labor in the public sector, in politics, in foreign affairs, and in foreign countries. Also included are a glossary of labor terms, sample labor contract clauses, and *Monthly Labor Review* indexes from 1971 through 1978.

The Rifkins forthrightly credit most of this material to the *Monthly Labor Review,* the BLS *Directory of National Unions and Employee Associations,* the *Handbook of Labor Statistics,* the *Employment and Training Report of the President, Federal Labor Laws and Programs,* and the *U.S. Government Manual.* Nevertheless, the *Sourcebook* carries a standard copyright admonition that "no part of this publication may be reproduced . . . without prior written permission of the publisher."

McGraw-Hill has announced plans to produce biennial updates of the *Sourcebook* "to insure the continuing analysis of contemporary developments in the American labor movement." *Monthly Labor Review* subscribers may have the advantage of being able to preview these updates in the *Review.*

National Directory of Women's Employment Programs: Who They Are; What They Do. Washington, Wider Opportunities for Women, Inc., 1979. $7.50.

This book contains comprehensive information on organizations serving the needs of women entering the work force. Such organizations typically provide job counseling, development, training and placement services; assistance to employers, unions, schools, and other institutions regarding women's employment; and research, organizing, or advocacy activities related to women's employment.

The *Directory* describes 140 organizations—their names, addresses, telephone numbers, objectives and histories, programs and services, contact persons, publications, and also gives information on the number of employees in the organization and its funding.

The organizations are listed by States in four regions: *Midwest*—Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Nebraska, Ohio, and Wisconsin; *Northeast* —Connecticut, Delaware, District of Columbia, Maryland, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, and Rhode Island; *South*—Alabama, Florida, Georgia, Kentucky, Louisiana, North Carolina, Tennessee, Texas, and Virginia; *West*—Arizona, California, Colorado, Hawaii, Oregon, Utah, and Washington.

Current Labor Statistics

Notes on Current Labor Statistics 66

Schedule of release dates for major BLS statistical series 66

Employment data from household survey. Definitions and notes 67
1. Employment status of noninstitutional population, selected years, 1950–78 67
2. Employment status by age, sex, and race, seasonally adjusted 68
3. Selected employment indicators, seasonally adjusted 69
4. Selected unemployment indicators, seasonally adjusted 70
5. Unemployment rates, by age and sex, seasonally adjusted 71
6. Unemployed persons, by reason for unemployment, seasonally adjusted 71
7. Duration of unemployment, seasonally adjusted 71

Employment, hours, and earnings data from establishment surveys. Definitions and notes 72
8. Employment by industry, 1949–78 73
9. Employment by State 73
10. Employment by industry division and major manufacturing group 74
11. Employment by industry division and major manufacturing group, seasonally adjusted 75
12. Labor turnover rates in manufacturing, 1976 to date 76
13. Labor turnover rates in manufacturing, by major industry group 76
14. Hours and earnings, by industry division, 1947–78 77
15. Weekly hours, by industry division and major manufacturing group 78
16. Weekly hours, by industry division and major manufacturing group, seasonally adjusted 79
17. Hourly earnings, by industry division and major manufacturing group 80
18. Hourly Earnings Index, by industry division 80
19. Weekly earnings, by industry division and major manufacturing group 81
20. Gross and spendable weekly earnings in current and 1967 dollars, 1960 to date 82

Unemployment insurance data. Definitions and notes 83
21. Unemployment insurance and employment service operations 83

Price data. Definitions and notes 84
22. Consumer Price Indexes, 1967–78 85
23. Consumer Price Index, U.S. city average, general summary and selected items 85
24. Consumer Price Index, cross classification of region and population size class 91
25. Consumer Price Index, selected areas 92
26. Producer Price Indexes, by stage of processing 93
27. Producer Price Indexes, by commodity grouping 94
28. Producer Price Indexes, for special commodity groupings 96
29. Producer Price Indexes, by durability of product 96
30. Price indexes for the output of selected SIC industries 96

Productivity data. Definitions and notes 99
31. Indexes of productivity and related data, 1950–78 99
32. Annual percent change in productivity and related data, 1968–78 100
33. Indexes of productivity, hourly compensation, and unit costs 100
34. Percent change in productivity, hourly compensation, and unit costs 101

Labor-management data. Definitions and notes 102
35. Wage and benefit settlements in major collective bargaining units 102
36. Effective wage rate adjustments going into effect in major collective bargaining units 103
37. Work stoppages, 1946 to date 103

NOTES ON CURRENT LABOR STATISTICS

This section of the *Review* presents the principal statistical series collected and calculated by the Bureau of Labor Statistics. A brief introduction to each group of tables provides definitions, notes on the data, sources, and other material usually found in footnotes.

Readers who need additional information are invited to consult the BLS regional offices listed on the inside front cover of this issue of the *Review*. Some general notes applicable to several series are given below.

Seasonal adjustment. Certain monthly and quarterly data are adjusted to eliminate the effect of such factors as climatic conditions, industry production schedules, opening and closing of schools, holiday buying periods, and vacation practices, which might otherwise mask short-term movements of the statistical series. Tables containing these data are identified as "seasonally adjusted." Seasonal effects are estimated on the basis of past experience. When new seasonal factors are computed each year, revisions may affect seasonally adjusted data for several preceding years. For a technical discussion of the method used to make seasonal adjustments, see "Appendix A. The BLS Seasonal Factor Method," *BLS Handbook of Methods for Surveys and Studies*, Bulletin 1910 (Bureau of Labor Statistics, 1976), pp. 272–78, and *X-11 Variant of the Census Method II Seasonal Adjustment Program*, Technical Paper No. 15 (Bureau of the Census, 1967). Seasonally adjusted employment data in tables 2–7 were last revised in the February 1979 issue of the *Review* to reflect the preceding year's experience. Annual revision of the seasonally adjusted payroll data in tables 11, 13, 16, and 18 was last introduced in the November 1979 issue of the *Review*. New seasonal factors for productivity data in tables 33 and 34 are usually introduced in the September issue. Seasonally adjusted indexes and percent changes from month to month and from quarter to quarter are published for numerous Consumer and Producer Price Index series. However, seasonally adjusted indexes are not published for the U.S. average All Items CPI. Only seasonally adjusted percent changes are available for this series.

Adjustments for price changes. Some data are adjusted to eliminate the effect of changes in price. These adjustments are made by dividing current dollar values by the Consumer Price Index or the appropriate component of the index, then multiplying by 100. For example, given a current hourly wage rate of $3 and a current price index number of 150, where 1967 = 100, the hourly rate expressed in 1967 dollars is $2 ($3/150 × 100 = $2). The resulting values are described as "real," "constant," or "1967" dollars.

Availability of information. Data that supplement the tables in this section are published by the Bureau of Labor Statistics in a variety of sources. Press releases provide the latest statistical information published by the Bureau; the major recurring releases are published according to the schedule given below. The *Handbook of Labor Statistics 1977*, Bulletin 1966, provides more detailed data and greater historical coverage for most of the statistical series presented in the *Monthly Labor Review*. More information from the household and establishment surveys is provided in *Employment and Earnings*, a monthly publication of the Bureau, and in two comprehensive data books issued annually—*Employment and Earnings, United States* and *Employment and Earnings, States and Areas*. More detailed information on wages and other aspects of collective bargaining appears in the monthly periodical, *Current Wage Developments*. More detailed price information is published each month in the periodicals, the *CPI Detailed Report* and *Producer Prices and Price Indexes*. Selected key statistical series are presented graphically in the monthly *Chartbook on Prices, Wages, and Productivity*.

Symbols

p = preliminary. To improve the timeliness of some series, preliminary figures are issued based on representative but incomplete returns.

r = revised. Generally this revision reflects the availability of later data but may also reflect other adjustments.

n.e.c. = not elsewhere classified.

Schedule of release dates for major BLS statistical series

Title and frequency (monthly except where indicated)	Release date	Period covered	Release date	Period covered	MLR table number
Producer Price Indexes	January 10	December	February 15	January	26 - 30
Employment situation	January 11	December	February 1	January	1 - 11
Consumer Price Index	January 25	December	February 22	January	22 - 25
Real earnings	January 25	December	February 22	January	14 - 20
Productivity and costs (quarterly):					
Nonfarm business and manufacturing	January 28	.....	.....	.....	31 - 34
Nonfinancial corporations	.....	.....	February 27	.....	31 - 34
Work stoppages	January 29	December	February 28	January	37
Labor turnover in manufacturing	January 30	December	February 29	January	12 - 13

EMPLOYMENT DATA FROM THE HOUSEHOLD SURVEY

EMPLOYMENT DATA in this section are obtained from the Current Population Survey, a program of personal interviews conducted monthly by the Bureau of the Census for the Bureau of Labor Statistics. The sample consists of about 56,000 households, selected to represent the U.S. population 16 years of age and older. Households are interviewed on a rotating basis, so that three-fourths of the sample is the same for any 2 consecutive months.

Definitions

Employed persons are (1) those who worked for pay any time during the week which includes the 12th day of the month or who worked unpaid for 15 hours or more in a family-operated enterprise and (2) those who were temporarily absent from their regular jobs because of illness, vacation, industrial dispute, or similar reasons. A person working at more than one job is counted only in the job at which he or she worked the greatest number of hours.

Unemployed persons are those who did not work during the survey week, but were available for work except for temporary illness and had looked for jobs within the preceding 4 weeks. Persons who were available for work but did not work because they were on layoff or waiting to start new jobs within the next 30 days are also counted among the unemployed. The **unemployment rate** represents the number unemployed as a percent of the civilian labor force.

The **civilian labor force** consists of all employed or unemployed persons in the civilian noninstitutional population; the **total labor force** includes military personnel. Persons **not in the labor force** are those not classified as employed or unemployed; this group includes persons retired, those engaged in their own housework, those not working while attending school, those unable to work because of longterm illness, those discouraged from seeking work because of personal or job market factors, and those who are voluntarily idle. The **noninstitutional population** comprises all persons 16 years of age and older who are not inmates of penal or mental institutions, sanitariums, or homes for the aged, infirm, or needy.

Full-time workers are those employed at least 35 hours a week; **part-time workers** are those who work fewer hours. Workers on part-time schedules for economic reasons (such as slack work, terminating or starting a job during the week, material shortages, or inability to find full-time work) are among those counted as being on full-time status, under the assumption that they would be working full time if conditions permitted. The survey classifies unemployed persons in full-time or part-time status by their reported preferences for full-time or part-time work.

Notes on the data

From time to time, and especially after a decennial census, adjustments are made in the Current Population Survey figures to correct for estimating errors during the preceding years. These adjustments affect the comparability of historical data presented in table 1.

Data for periods prior to January 1978 are not strictly comparable with current data because of the introduction of an expansion in the sample and revisions in the estimation procedures. For an explanation of the supplementation procedures and an indication of the differences, see "Revisions in the Current Population Survey in January 1978," *Employment and Earnings*, February 1978, pp. 7–10.

Data in tables 2–7 are seasonally adjusted, based on the seasonal experience through December 1978.

1. Employment status of the noninstitutional population, 16 years and over, selected years, 1950–78

[Numbers in thousands]

Year	Total noninstitutional population	Total labor force		Civilian labor force						Not in labor force

EMPLOYMENT, HOURS, AND EARNINGS DATA FROM ESTABLISHMENT SURVEYS

EMPLOYMENT, HOURS, AND EARNINGS DATA in this section are compiled from payroll records reported monthly on a voluntary basis to the Bureau of Labor Statistics and its cooperating State agencies by 162,000 establishments representing all industries except agriculture. In most industries, the sampling probabilities are based on the size of the establishment; most large establishments are therefore in the sample. (An establishment is not necessarily a firm; it may be a branch plant, for example, or warehouse.) Self-employed persons and others not on a regular civilian payroll are outside the scope of the survey because they are excluded from establishment records. This largely accounts for the difference in employment figures between the household and establishment surveys.

LABOR TURNOVER DATA in this section are compiled from personnel records reported monthly on a voluntary basis to the Bureau of Labor Statistics and its cooperating State agencies. A sample of 40,000 establishments represents all industries in the manufacturing and mining sectors of the economy.

Definitions

Employed persons are all persons who received pay (including holiday and sick pay) for any part of the payroll period including the 12th of the month. Persons holding more than one job (about 5 percent of all persons in the labor force) are counted in each establishment which reports them.

Production workers in manufacturing include blue-collar worker supervisors and all nonsupervisory workers closely associated with production operations. Those workers mentioned in tables 14–20 include production workers in manufacturing and mining; construction workers in construction; and nonsupervisory workers in transportation and public utilities, in wholesale and retail trade, in finance, insurance, and real estate, and in service industries. These groups account for about four-fifths of the total employment on private nonagricultural payrolls.

Earnings are the payments production or nonsupervisory workers receive during the survey period, including premium pay for overtime or late-shift work but excluding irregular bonuses and other special payments. **Real earnings** are earnings adjusted to eliminate the effects of price change. The **Hourly Earnings Index** is calculated from average hourly earnings data adjusted to exclude the effects of two types of changes that are unrelated to underlying wage-rate developments: fluctuations in overtime premiums in manufacturing (the only sector for which overtime data are available) and the effects of changes and seasonal factors in the proportion of workers in high-wage and low-wage industries. **Spendable earnings** are earnings from which estimated social security and Federal income taxes have been deducted. The Bureau of Labor Statistics computes spendable earnings from gross weekly earnings for only two illustrative cases: (1) a worker with no dependents and (2) a married worker with three dependents.

Hours represent the average weekly hours of production or nonsupervisory workers for which pay was received and are different from standard or scheduled hours. **Overtime hours** represent the portion of gross average weekly hours which were in excess of regular hours and for which overtime premiums were paid.

Labor turnover is the movement of all wage and salary workers from one employment status to another. **Accession rates** indicate the average number of persons added to a payroll in a given period per 100 employees; **separation rates** indicate the average number dropped from a payroll per 100 employees. Although month-to-month changes in employment can be calculated from the labor turnover data, the results are not comparable with employment data from the employment and payroll survey. The labor turnover survey measures changes during the calendar month while the employment and payroll survey measures changes from midmonth to midmonth.

Notes on the data

Establishment data collected by the Bureau of Labor Statistics are periodically adjusted to comprehensive counts of employment (called "benchmarks"). The latest complete adjustment was made with the release of September 1979 data, published in the November 1979 issue of the *Review*. Consequently, data published in the *Review* prior to that issue are not necessarily comparable to current data. Complete comparable historical unadjusted and seasonally adjusted data are published in a Supplement to Employment and Earnings (unadjusted data from April 1977 through June 1979 and seasonally adjusted data from January 1974 through June 1979) and in *Employment and Earnings, United States, 1909–78*, BLS Bulletin 1312–11 (for prior periods).

Data on recalls were shown for the first time in tables 12 and 13 in the January 1978 issue of the *Review*. For a detailed discussion of the recalls series, along with historical data, see "New Series on Recalls from the Labor Turnover Survey," *Employment and Earnings*, December 1977, pp. 10–19.

A comprehensive discussion of the differences between household and establishment data on employment appears in Gloria P. Green, "Comparing employment estimates from household and payroll surveys," *Monthly Labor Review*, December 1969, pp. 9–20. See also *BLS Handbook of Methods for Surveys and Studies*, Bulletin 1910 (Bureau of Labor Statistics, 1976).

The formulas used to construct the spendable average weekly earnings series reflect the latest provisions of the Federal income tax and social security tax laws. For the spendable average weekly earnings formulas for the years 1977–79, see *Employment and Earnings*, September 1979, pp. 6–8. Beginning with data for January 1978, real earnings data are adjusted using the revised Consumer Price Index for Urban Wage Earners and Clerical Workers. Data prior to January 1978 are based on the unrevised Consumer Price Index for Urban Wage Earners and Clerical Workers.

c = Corrected.

NOTE: The earnings expressed in 1967 dollars have been adjusted for changes in price level as measured by the Bureau's Consumer Price Index for Urban Wage Earners and Clerical Workers (revised). These series are described in "The Spendable Earnings Series: A Technical Note on its Calculation", **Employment and Earnings and Monthly Report on the Labor Force**, February 1969, pp. 6 – 13, See also "Spendable Earnings Formulas, 1977 – 79" **Employment and Earnings**. September 1979, pp. 6 – 8.

UNEMPLOYMENT INSURANCE DATA

UNEMPLOYMENT INSURANCE DATA are compiled monthly by the Employment and Training Administration of the U.S. Department of Labor from records of State and Federal unemployment insurance claims filed and benefits paid. Railroad unemployment insurance data are prepared by the U.S. Railroad Retirement Board.

Definitions

Data for **all programs** represent an unduplicated count of insured unemployment under the State, Ex-Servicemen, and UCFE programs, and the Railroad Insurance Act.

Under both State and Federal unemployment insurance programs for civilian employees, insured workers must report the completion of at least 1 week of unemployment before they are defined as unemployed. Persons not covered by unemployment insurance (about one-third of the labor force) and those who have exhausted or not yet earned benefit rights are excluded from the scope of the survey. **Initial claims** are notices filed by persons in unemployment insurance programs to indicate they are out of work and wish to begin receiving compensation. A claimant who continued to be unemployed a full week is then counted in the insured unemployment figure. The **rate of insured unemployment** expresses the number of insured unemployed as a percent of the average insured employment in a 12-month period.

An **application** for benefits is filed by a railroad worker at the beginning of his first period of unemployment in a benefit year; no application is required for subsequent periods in the same year. **Number of payments** are payments made in 14-day registration periods. The **average amount of benefit payment** is an average for all compensable periods, not adjusted for recovery of overpayments or settlement of underpayments. However, **total benefits** paid have been adjusted.

21. Unemployment insurance and employment service operations

[All items except average benefits amounts are in thousands]

Item	1978			1979									
	Oct.	Nov.	Dec.	Jan.	Feb.	Mar.	Apr.	May	June	July	Aug.	Sept.	Oct.

[1] Initial claims and State insured unemployment include data under the program for Puerto Rican sugarcane workers.

[2] Includes interstate claims for the Virgin Islands. Excludes transition claims under State programs.

[3] Excludes data on claims and payments made jointly with other programs.

[4] Includes the Virgin Islands. Excludes data on claims and payments made jointly with State programs.

[5] Cumulative total for fiscal year (October 1 - September 30).

NOTE: Data for Puerto Rico included. Dashes indicate data not available.

PRICE DATA

PRICE DATA are gathered by the Bureau of Labor Statistics from retail and primary markets in the United States. Price indexes are given in relation to a base period (1967 = 100, unless otherwise noted).

Definitions

The **Consumer Price Index** is a monthly statistical measure of the average change in prices in a fixed market basket of goods and services. Effective with the January 1978 index, the Bureau of Labor Statistics began publishing CPI's for two groups of the population. One index, a new CPI for All Urban Consumers, covers 80 percent of the total noninstitutional population; and the other index, a revised CPI for Urban Wage Earners and Clerical Workers, covers about half the new index population. The All Urban Consumers index includes, in addition to wage earners and clerical workers, professional, managerial, and technical workers, the self-employed, short-term workers, the unemployed, retirees, and others not in the labor force.

The CPI is based on prices of food, clothing, shelter, fuel, drugs, transportation fares, doctor's and dentist's fees, and other goods and services that people buy for day-to-day living. The quantity and quality of these items is kept essentially unchanged between major revisions so that only price changes will be measured. Prices are collected from over 18,000 tenants, 24,000 retail establishments, and 18,000 housing units for property taxes in 85 urban areas across the country. All taxes directly associated with the purchase and use of items are included in the index. Because the CPI's are based on the expenditures of two population groups in 1972–73, they may not accurately reflect the experience of individual families and single persons with different buying habits.

Though the CPI is often called the "Cost-of-Living Index," it measures only price change, which is just one of several important factors affecting living costs. Area indexes do not measure differences in the level of prices among cities. They only measure the average change in prices for each area since the base period.

Producer Price Indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. The sample used for calculating these indexes contains about 2,800 commodities and about 10,000 quotations per month selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer Price Indexes can be organized by stage of processing or by commodity. The stage of processing structure organizes products by degree of fabrication (that is, finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

To the extent possible, prices used in calculating Producer Price Indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Most prices are obtained directly from producing companies on a voluntary and confidential basis. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating Producer Price Indexes, price changes for the various commodities are averaged together with implicit quantity weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage of processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings.

Price indexes for the output of selected SIC industries measure average price changes in commodities produced by particular industries, as defined in the *Standard Industrial Classification Manual 1972* (Washington, U.S. Office of Management and Budget, 1972). These indexes are derived from several price series, combined to match the economic activity of the specified industry and weighted by the value of shipments in the industry. They use data from comprehensive industrial censuses conducted by the U.S. Bureau of the Census and the U.S. Department of Agriculture.

Notes on the data

Beginning with the May 1978 issue of the *Review*, regional CPI's cross classified by population size, were introduced. These indexes will enable users in local areas for which an index is not published to get a better approximation of the CPI for their area by using the appropriate population size class measure for their region. The cross-classified indexes will be published bimonthly. (See table 24.)

For further details about the new and the revised indexes and a comparison of various aspects of these indexes with the old unrevised CPI, see *Facts About the Revised Consumer Price Index*, a pamphlet in the Consumer Price Index Revision 1978 series. See also *The Consumer Price Index: Concepts and Content Over the Years*. Report 517, revised edition (Bureau of Labor Statistics, May 1978).

For interarea comparisons of living costs at three hypothetical standards of living, see the family budget data published in the *Handbook of Labor Statistics, 1977*, Bulletin 1966 (Bureau of Labor Statistics, 1977), tables 122–133. Additional data and analysis on price changes are provided in the *CPI Detailed Report* and *Producer Prices and Price Indexes*, both monthly publications of the Bureau.

As of January 1976, the Wholesale Price Index (as it was then called) incorporated a revised weighting structure reflecting 1972 values of shipments. From January 1967 through December 1975, 1963 values of shipments were used as weights.

For a discussion of the general method of computing consumer, producer, and industry price indexes, see *BLS Handbook of Methods for Surveys and Studies*, Bulletin 1910 (Bureau of Labor Statistics, 1976), chapters 13–15. See also John F. Early, "Improving the measurement of producer price change," *Monthly Labor Review*, April 1978, pp. 7–15. For industry prices, see also Bennett R. Moss, "Industry and Sector Price Indexes," *Monthly Labor Review*, August 1965, pp. 974–82.

[1] Prices for natural gas are lagged 1 month.

[2] Includes only domestic production.

[3] Most prices for refined petroleum products are lagged 1 month.

[4] Some prices for industrial chemicals are lagged 1 month.

[5] Not available.

NOTE: Data for July 1979 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication.

28. Producer Price Indexes, for special commodity groupings

[1967 = 100 unless otherwise specified]

Commodity grouping	Annual average 1978	1978		1979										
		Nov.	Dec.	Jan.	Feb.	Mar.	Apr.	May	June	July	Aug.	Sept.	Oct.	Nov.
All commodities — less farm products	206.4	214.8	216.3	219.3	222.0	224.7	228.0	230.1	232.0	235.4	237.3	241.0	244.9	246.7
All foods	206.4	211.7	215.5	219.9	225.0	225.9	227.7	226.4	223.8	225.4	224.5	228.2	226.8	229.0
Processed foods	206.7	211.9	215.7	219.8	223.5	225.6	227.8	227.5	224.7	226.4	224.5	230.6	228.9	231.8
Industrial commodities less fuels	197.2	203.6	204.6	207.3	209.6	211.9	214.7	216.0	217.0	219.0	220.1	221.6	225.4	226.4
Selected textile mill products (Dec. 1975 = 100)	108.8	110.0	110.9	109.1	110.8	111.6	112.3	112.8	113.5	114.0	115.0	115.7	116.0	116.1
Hosiery	106.3	109.1	106.7	110.1	109.9	110.5	112.5	112.5	112.7	114.1	113.0	112.7	113.0	114.6
Underwear and nightwear	158.9	160.3	162.5	164.6	166.3	167.1	167.3	167.7	168.3	168.5	170.8	170.8	171.2	171.6
Chemicals and allied products, including synthetic rubber and manmade fibers and yarns	190.5	193.1	193.6	196.3	198.0	200.0	204.1	207.6	209.5	215.0	217.4	220.5	223.7	226.0

NOTE: Data for July 1979 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication.

PRODUCTIVITY DATA

PRODUCTIVITY DATA are compiled by the Bureau of Labor Statistics from establishment data and from estimates of compensation and output supplied by the U.S. Department of Commerce and the Federal Reserve Board.

Definitions

Output is the constant dollar gross domestic product produced in a given period. Indexes of **output per hour of labor input**, or labor productivity, measure the value of goods and services produced per hour of labor. **Compensation per hour** includes wages and salaries of employees plus employers' contributions for social insurance and private benefit plans. The data also include an estimate of wages, salaries, and supplementary payments for the self-employed, except for nonfinancial corporations, in which there are no self-employed. **Real compensation per hour** is compensation per hour adjusted by the Consumer Price Index for All Urban Consumers.

Unit labor cost measures the labor compensation cost required to produce one unit of output and is derived by dividing compensation by output. **Unit nonlabor payments** include profits, depreciation, interest, and indirect taxes per unit of output. They are computed by subtracting compensation of all persons from the current dollar gross domestic product and dividing by output. In these tables, **Unit nonlabor costs** contain all the components of unit nonlabor payments except unit profits. **Unit profits** include corporate profits and inventory valuation adjustments per unit of output.

The **implicit price deflator** is derived by dividing the current dollar estimate of gross product by the constant dollar estimate, making the deflator, in effect, a price index for gross product of the sector reported.

The use of the term "man-hours" to identify the labor component of productivity and costs, in tables 31 through 34, has been discontinued. **Hours of all persons** is now used to describe the labor input of payroll workers, self-employed persons, and unpaid family workers. **Output per all-employee hour** is now used to describe labor productivity in nonfinancial corporations where there are no self-employed.

Notes on the data

In the private business sector and the nonfarm business sector, the basis for the output measure employed in the computation of output per hour is Gross Domestic Product rather than Gross National Product. Computation of hours includes estimates of nonfarm and farm proprietor hours.

Output data are supplied by the Bureau of Economic Analysis, U.S. Department of Commerce, and the Federal Reserve Board. Quarterly manufacturing output indexes are adjusted by the Bureau of Labor Statistics to annual estimates of output (gross product originating) from the Bureau of Economic Analysis. Compensation and hours data are from the Bureau of Economic Analysis and the Bureau of Labor Statistics.

Beginning with the September 1976 issue of the *Review*, tables 31–34 were revised to reflect changeover to the new series—private business sector and nonfarm business sector—which differ from the previously published total private economy and nonfarm sector in that output imputed for owner-occupied dwellings and the household and institutions sectors, as well as the statistical discrepancy, are omitted. For a detailed explanation, see J. R. Norsworthy and L. J. Fulco, "New sector definitions for productivity series," *Monthly Labor Review*, October 1976, pages 40–42.

LABOR-MANAGEMENT DATA

MAJOR COLLECTIVE BARGAINING DATA are obtained from contracts on file at the Bureau of Labor Statistics, direct contact with the parties, and from secondary sources. Additional detail is published in *Current Wage Developments*, a monthly periodical of the Bureau. Data on work stoppages are based on confidential responses to questionnaires mailed by the Bureau of Labor Statistics to parties involved in work stoppages. Stoppages initially come to the attention of the Bureau from reports of Federal and State mediation agencies, newspapers, and union and industry publications.

Definitions

Data on wage changes apply to private nonfarm industry agreements covering 1,000 workers or more. Data on wage and benefit changes *combined* apply only to those agreements covering 5,000 workers or more. **First-year wage settlements** refer to pay changes going into effect within the first 12 months after the effective date of the agreement. **Changes over the life of the agreement** refer to total agreed upon settlements (exclusive of potential cost-of-living escalator adjustments) expressed at an average annual rate. **Wage-rate changes** are expressed as a percent of straight-time hourly earnings, while **wage and benefit changes** are expressed as a percent of total compensation.

Effective wage-rate adjustments going into effect in major bargaining units measure changes actually placed into effect during the reference period, whether the result of a newly negotiated increase, a deferred increase negotiated in an earlier year, or as a result of a cost-of-living escalator adjustment. Average adjustments are affected by workers receiving no adjustment, as well as by those receiving increases or decreases.

Work stoppages include all known strikes or lockouts involving six workers or more and lasting a full shift or longer. Data cover all workers idle one shift or more in establishments directly involved in a stoppage. They do not measure the indirect or secondary effect on other establishments whose employees are idle owing to material or service shortages.

35. Wage and benefit settlements in major collective bargaining units, 1973 to date
[In percent]

Sector and measure	Annual average						Quarterly average					
	1973	1974	1975	1976	1977	1978	1978			1979

How to order BLS publications

PERIODICALS

Order from (and make checks payable to) Superintendent of Documents, Washington, D.C. 20402. For foreign subscriptions, add 25 percent.

Monthly Labor Review. The oldest and most authoritative government research journal in economics and the social sciences. Current statistics, analysis, developments in industrial relations, court decisions, book reviews. $18 a year, single copy, $2.50.

Employment and Earnings. A comprehensive monthly report on employment, hours, earnings, and labor turnover by industry, area, occupation, et cetera $22 a year, single copy $2.75.

Occupational Outlook Quarterly. A popular periodical designed to help high school students and guidance counselors assess career opportunities. $6 for four issues, single copy $1.75.

Current Wage Developments. A monthly report about collective bargaining settlements and unilateral management decisions about wages and benefits; statistical summaries. $12 a year, single copy $1.35.

Producer Prices and Price Indexes. A comprehensive monthly report on price movements of both farm and industrial commodities, by industry and stage of processing. $17 a year, single copy $2.25.

CPI Detailed Report. A monthly periodical featuring detailed data and charts on the Consumer Price Index. $15 a year, single copy $2.25.

PRESS RELEASES

The Bureau's statistical series are made available to news media through press releases issued in Washington. Many of the releases also are available to the public upon request. Write: Bureau of Labor Statistics, Washington, D.C. 20212.

Regional. Each of the Bureau's eight regional offices publishes reports and press releases dealing with regional data. Single copies available free from the issuing regional office.

BULLETINS AND HANDBOOKS

About 140 bulletins and handbooks published each year are for sale by regional offices of the Bureau of Labor Statistics (see inside front cover) and by the Superintendent of Documents. Washington, D.C. 20402. Make checks payable to the Superintendent of Documents. Among the bulletins and handbooks currently in print are these:

Occupational Outlook Handbook, 1978–79 Edition. Bulletin 1955. A useful resource supplying valuable assistance to all persons seeking satisfying and productive employment. $8, paperback; $11 hard cover.

BLS Handbook of Labor Statistics 1978. Bulletin 2000. A 604-page volume of historical data on the major BLS statistical series. $9.50.

Handbook of Methods. Bulletin 1910. Brief technical account of each major statistical program of the Bureau of Labor Statistics. $3.50.

BLS Measures of Compensation. Bulletin 1941. An introduction to the various measures of employee compensation; describes each series, the manner in which it is developed, its uses and limitations. $2.75.

Occupational Projections and Training Data. Bulletin 2020. Presents both general and detailed information on the relationship between occupational requirements and training needs. (Updates Bulletin 1918 published in 1976.) $3.25.

Technological Change and its Labor Impact in Five Energy Industries. Bulletin 2005. A 64-page study appraising major technological change and discussing the impact of these changes on productivity and occupations over the next 5 to 10 years. $2.40.

BLS Publications, 1972–77. Bulletin 1990. A numerical listing and subject index of bulletins and reports issued by the Bureau from 1972 through 1977, supplementing Bulletin 1749, covering 1886–1971. $1.80.

International Comparisons of Unemployment. Bulletin 1979. Brings together all of the Bureau's work on international unemployment comparisons. Describes the methods of adjusting foreign unemployment rates in 8 countries to U.S. concepts. $3.50.

REPORTS AND PAMPHLETS

Single copies available free from the BLS regional offices or from the Bureau of Labor Statistics, U. S. Department of Labor, Washington, D.C. 20212.

Occupational Injuries and Illnesses in 1977: Summary. Report 561. Statistical estimates of incidence rates for and number of occupational illnesses and injuries in the United States during 1976 and 1977.

How the Government Measures Unemployment. Report 505. A concise report providing a background for appraising developments in the area of unemployment.

Where to Find BLS Statistics on Women. Report 530. A summary of the statistics on women which are available from the Bureau of Labor Statistics and where they may be found.

Directory of BLS Studies in Industrial Relations 1960–78. Report 550. A listing of studies prepared by the Division of Industrial Relations as part of the Bureau's regular program of data collection and analysis in the field of industrial relations.

Labor Month In Review

CPI CONTROVERSY. A frequent criticism of the Consumer Price Index is that the CPI overstates the cost of living because the index is based on a fixed market basket and therefore does not reflect continuing changes consumers make in their buying habits. Commissioner of Labor Statistics Janet L. Norwood addressed that and other issues at a Jan. 21 meeting of the National Association of Government Labor Officials, in Washington, D.C. Excerpts:

The market basket. The CPI is based on a fixed market basket. That is, the weights for the mix of goods and services purchased during the base period are held constant from year to year until a major revision occurs. We keep the market basket constant deliberately because we want to keep fixed the living standard represented by that market basket. Our purpose, to the extent possible, is to isolate price changes from other changes which may occur in living standards.

BLS economists, of course, know that consumers shift their purchases in response to changes in relative prices. What we do not know, however, is whether such changes in consumption patterns result in a living standard that is higher or lower than that in the base period. If the market basket were changed whenever prices change—without knowing whether the consumer is equally satisfied with the shift—we would not know whether a change in the index was caused by a change in prices or by a change in the market basket. Because a market basket change could amount to a change in living standards, those whose income payments are adjusted by the CPI would not be assured that their living standards would remain at the same level. The purpose of such CPI cost-of-living adjustment (indexation) has traditionally been to permit people to purchase in today's prices the bundle of goods and services they purchased in the base period, thereby leaving them at least as well off as they were then.

The following example will illustrate my point. If, in adjusting to higher prices, a family decides to forgo its weekly restaurant dinner, the family is both changing its market basket and lowering its satisfaction or standard of living. If the objective of indexation is to ensure purchasing power necessary to preserve living standards, a measure used to index income should not reflect this kind of a market basket change.

Special purpose indexes. Users of the CPI should be aware of the many subindexes which are produced as a part of the CPI system. These are published prominently in the monthly CPI news release, are used for analytical and other purposes, and, in some cases, are used for indexation. Among these subindexes, for example, is an index for "All Items minus mortgage interest costs" and another for "All Items less energy."

BLS also can produce other indexes if they are required. Special indexes may be needed when government pursues social goals which—at least in the short run—may raise prices. Should it be considered socially desirable to reduce energy consumption by raising gasoline prices, consumers would pay more for gasoline and the index measuring the rate of inflation would and should go up. It might be useful to policymakers, in such a case, to create a special index which could exclude such increases or which could treat other policy-directed price changes, such as changes in interest rates, in a special way. Some also have suggested the desirability of a special index—for use in pension escalation—that would represent the expenditure experience of persons receiving retirement benefits.

The BLS is a service agency. Given the resources and time necessary, the Bureau can produce special consumer price indexes for particular needs. We should not, however, permit these other needs to weaken the ability of the present CPI to fulfill the objective for which it was intended.

Homeownership. Commissioner Norwood also introduced five alternative—and experimental—ways of measuring the CPI's most controversial component, the cost of homeownership. She announced that BLS will publish these measures monthly, but will make no change in the official index at this time. (An article about measuring costs of owner-occupied housing appears on pages 31-35 of this issue.) The full text of Commissioner Norwood's discussion of the CPI is available from the Bureau of Labor Statistics, Washington, D.C. 20212. □

Employment and unemployment during 1979: an analysis

Labor force and employment growth slowed from the rapid pace of the previous 3 years; the unemployment rate showed virtually no movement

CAROL BOYD LEON AND PHILIP L. RONES

The Nation's employment situation in 1979 was highlighted by a slowdown in the rate of job growth. Employment and labor force growth, while still fairly strong at about 2 million each, was considerably slower than during the previous 3 years. The unemployment rate, which ended the year at 5.9 percent, remained in the range of 5.8–5.9 percent for 5 consecutive quarters.[1]

Adult women,[2] who had made up about half of the total employment increase between 1976 and 1978, accounted for about two-thirds of the gain in 1979. Adult men made up the remainder of the over-the-year job growth, as teenagers experienced a slight decline.

Most of the major population groups experienced little change in their rate of joblessness. Adult men posted a 0.2-percentage point rise in their unemployment rate, while the rates for adult women and teenagers showed little change. Movements in several series which are influenced by the business cycle suggested a weakening in some sectors of the job market. For instance, the unemployment rate advanced about a point in the manufacturing industries, and employment in this sector was only slightly above its year-earlier level. In addition, the number of unemployed persons on layoff and the number of persons working part time for economic reasons each increased by about a quarter of a million.

Nonfarm payroll employment—as measured by the survey of business establishments—increased by 2.4 million in 1979.[3] While manufacturing employment showed virtually no over-the-year increase, employment growth was strong in construction and mining as well as in several of the service-producing divisions. The service-producing sector accounted for three-quarters of the overall employment gains.

Slower employment growth

Employment growth slowed considerably in 1979, after 3 consecutive years of rapid advances. Civilian employment in late 1979 totaled 97.7 million, 2.0 million higher than a year earlier. (See table 1.) In contrast, employment had grown by 3.3 million in 1978. The employment level in 1979 exhibited disparate movements throughout the year: relatively strong advances were registered in both the first and third quarters, but growth was slower in the fourth quarter and the number of jobholders held about steady in the second quarter.

Although employment growth among adult women was 75 percent of the previous year's increase, the proportion of the total employment gain attributable to women was even higher than it had been during the previous year. The increase in jobholding among women—1.4 million in 1979—accounted for most of the over-the-year growth in employment. This growth occurred without any lessening of unemployment because

[1] Data for the fourth quarter are preliminary.

NOTE: Comparisons of 1978 household survey data with earlier data are affected by the introduction of an expansion in the sample and revisions in the estimation procedure which raised total employment by roughly a quarter of a million. Unemployment was essentially unchanged.

the female labor force expanded considerably. The number of employed adult men rose by about 700,000, about half the group's increase in the prior year.

In contrast to the preceding year, teenagers did not share in the 1979 employment growth. After an advance of 200,000 in 1978, teenage jobholding was about unchanged in 1979, in part, because the teenage population started to drop off as the "baby boom" generation was moving out of the teen years. Also, there was a slight drop in the labor force participation rate of teenagers which may have contributed to their lack of employment growth.

Employment-population ratios, which measure the proportion of a population group that is employed, help to delineate trends among various demographic categories. While the employment-population ratio increased slightly for all workers during 1979, the ratio for women rose while that for men declined. (See table 2.) Modest declines occurred among all major age categories of men, except those 25 to 34 years, whose ratio was unchanged. Generally, the employment increases among men were too small to keep pace with population growth. The largest decline took place among men 55 and over. While most age groups of women posted increases in employment-population ratios, women age 20 to 24 years experienced a decline. (The ratio for these women advanced substantially in 1978 and earlier years.) But the growth among women age 25 and over continued to be rather strong, especially among those age 35 to 44, whose ratio advanced by nearly 3 points to about 63 percent. These women have the highest female employment-population ratio.

Industry developments. Nonfarm payroll employment rose by 2.4 million over the year to 90.2 million. The payroll employment level increased in each quarter, but the increases in the early quarters were larger than those later in the year.

Over the year, each nonfarm industry division showed some job growth. More than three-fourths of the growth took place in the service-producing sector. About half of that increase was in the services division, which absorbed 1 of 3 additional jobs, followed by the wholesale and retail trade divisions, with 1 of 5. In terms of relative growth, services again was on top, followed by finance, insurance, and real estate; transportation and public utilities; and wholesale trade. The other service-producing divisions—retail trade and government—grew at a slower pace than the overall economy.

Within the goods-producing sector, the number of payroll jobs in manufacturing changed little. It should be noted that manufacturing was the first industry division to experience employment losses during the 1974–75 recession, followed by construction. However, in 1979, construction and mining showed the greatest relative growth of all nonfarm divisions.

Within manufacturing, the durable goods industries—which had posted strong job growth in the prior

3 years—showed only small advances, as the employment level grew rapidly in the first quarter, held steady during the middle quarters, and ended the year under moderate contraction. Substantial over-the-year gains did take place in a few of the durables industries, but an overall weakness was evidenced by the lack of growth in consumption levels for durables and an actual drop in constant dollars.[4] A noteworthy development during 1979 occurred in the transportation equipment industry: despite the loss of more than 100,000 jobs in the motor vehicles and equipment and travel trailers and campers industries, there was a smaller overall employment drop as that decline was partially offset by significant gains in other transportation equipment industries—especially aircraft and parts.

Also within the manufacturing division, nondurables experienced a year of no job growth. Despite an extremely large increase in consumer outlays on gasoline and oil (in current dollars), there was little reflection of this in refining and processing employment. Only printing and publishing exhibited fairly strong growth, continuing its postrecession upward trend.

Occupational changes. Employment increased in all major white-collar occupations during 1979, but declined in most other occupations. (See table 3.) The fastest-growing occupations were salesworkers, managers and administrators and professionals. The rate of growth among clerical workers was somewhat slower, but because of their numbers, that group accounted for one-fourth of the overall employment increase; managerial and professional workers together contributed one-half of the total advance. The remaining 25 percent of total employment growth was accounted for by craft workers and salesworkers. Employment was unchanged for operatives and service workers, dropped modestly for farm workers, and dropped substantially for nonfarm laborers.

The occupational employment changes in 1979 contrasted markedly with those of the previous several years, when blue-collar jobs generally grew faster than white-collar positions. Managerial jobs had grown less than any occupation, except farmworkers. Blue-collar employment generally is more sensitive to economic cycles; it declined substantially during the 1975 recession and posted strong increases during the recovery years of 1976–78. The lessening of economic growth in 1979 resulted in the smaller total employment increase being concentrated among white-collar occupations, which had remained fairly stable during the recession and had grown steadily, but less spectacularly than blue-collar jobs, during the recovery years.

Full- and part-time workers. As occurred in 1978, virtually all of the increase in employment in 1979 took place among full-time workers.[5] Persons employed full time posted a gain of 1.5 million, of which 1.1 million were adult women; the remainder were adult men, as teenagers registered almost no change in full-time employment. The demographic pattern was similar among voluntary part-time workers, except that teenage employment dropped substantially.[6]

Although most women work full time, more than half of all persons working part time by choice were women. There also were substantial proportions of men and teenagers among the part-timers, as shown in the following percentage distribution of 1979 annual employment averages:

	Full time	*Voluntary part time*	*Part time for economic reasons*
Total employed (percent)	100	100	100
Adult men	60	18	36
Adult women	35	55	45
Teenagers	5	27	19

As the tabulation shows, there is a third group of workers—persons employed part time for economic reasons. These are persons who want full-time jobs but are working part time because of slack work, inability to find full-time work or other economic reasons. In late 1979, there were 3.4 million such persons in nonfarm industries. In other words, about 1 of 5 persons working part time was doing so for economic reasons. After declining by 100,000 in 1978, the number of persons at work part time for economic reasons increased by more than 200,000 in 1979, and much of the advance occurred in the fourth quarter.[7] Generally, persons working part time for economic reasons do so because they are unable to find a full-time job, but in 1979, most of the increase was among persons who usually work full time, but whose hours had been curtailed. This was the first time since the 1974–75 recession that the number of persons employed part time for economic reasons failed to decline. While the number of persons on full-time schedules or voluntarily employed part time each increased by about 2 percent, the level of total part-time employment for economic reasons advanced by 8 percent. Growth in voluntary part-time employment generally is interpreted as a favorable development, but this is not true of those employed part time for economic reasons.

Hours and earnings

Average weekly hours of production or nonsupervisory workers on private nonfarm payrolls were 35.7 in late 1979, down from 35.8 a year earlier. (See table 1.) The manufacturing workweek was shortened by about one-half hour during 1979, with an even larger reduction occurring in the second quarter and only partial recov-

[1] Over-the-year employment changes represent a comparison between the fourth quarter of the previous year and the fourth quarter of the year shown, using not seasonally adjusted data. The 1978 change allows for the changes in the CPS introduced in January 1978.

[2] Occupational employment estimates are derived from the CPS.

[3] Less than 0.05 percent.

[4] Industry estimates are from the BLS survey of establishments. Data for 1979 are preliminary.

[5] The uneven growth pattern in mining primarily results from a major strike affecting the employment level in the fourth quarter of 1977.

ery in the following quarter. Most of the decline was in the more cyclically-sensitive durable goods manufacturing. Other industry divisions also recorded over-the-year declines, and only mining showed a modest advance.

The aggregate hours index—a comprehensive measure which takes into account both the number of production or nonsupervisory employees on nonfarm payrolls and their weekly hours—rose 2.2 percentage points to 126.3 (1967=100). This gain was entirely due to the over-the-year rise in employment. Manufacturing was the only industry division to experience a drop in aggregate hours index in 1979.

Average hourly earnings of production or nonsupervisory workers on private nonfarm payrolls were $6.33 in the last quarter of 1979, compared with $5.88 a year earlier—a rise of about 8 percent. Gross average weekly earnings posted a similar percentage increase, advancing by $16 over the year to $226. In constant dollars (1967=100), weekly earnings decreased by about 5 percent in 1979.

Unemployment stable

The Nation's unemployment rate remained at about the late-1978 level throughout 1979, as quarterly rates were 5.8 percent, except for the fourth quarter, which was 5.9 percent. The rates for adult women (5.7 percent in the fourth quarter of 1979), and teenagers (16.1 percent) each were about unchanged between late 1978 and 1979, while the rate for adult men (4.2 percent) rose several tenths of a point. The number of unemployed persons, 6.1 million, was up by about 200,000, with adult men and women each representing about 2.3 and 2.2 million of the unemployed. Table 1 shows recent trends in unemployment for major labor force groups.

The slight increase in joblessness over the year appeared to be affecting many families which were already experiencing some unemployment. The number of families with both spouses unemployed was relatively small—about 100,000 in the fourth quarter of 1979—but was about 25 percent above its year-earlier figure. An indication that unemployment often runs in families was that about 1 of 10 jobless husbands had a wife who also was unemployed, while only about 1 of 40 wives in the population was unemployed.

Reasons for unemployment. The reasons cited by unemployed persons for their joblessness often serve as an indicator of cyclical activity. An increase in unemployment caused by unusually rapid labor force growth, for instance, would be less a sign of economic weakness than an increase of the same magnitude resulting from employee layoffs. The proportion of persons who cited a job loss as their reason for unemployment increased over the year, from 41 to 45 percent; during the 1974–75 recession, that proportion rose to as high as 57 percent. (See table 4.)

The rate of unemployment due to job loss is about the same for men and women. However, proportionally fewer unemployed women than men give this as their reason for unemployment. The difference is a result of the overall higher unemployment rate of women, which reflects their greater likelihood of experiencing unemployment due to labor force reentry. Most of the recent expansion in the number and proportion of unemployed who had lost their last job could be attributed to persons who had been laid off, even though that group makes up only about a third of all job losers. (Most job losers are those whose jobs have been terminated and who do not expect to be recalled.)

Table 4. Unemployment by reasons and duration, selected quarters, seasonally adjusted

[Percent distribution]

15 weeks and over	20.9	32.2	21.1	21.3	20.2	19.0	19.9
15 to 26 weeks	12.0	18.6	12.1	12.1	11.5	10.7	11.3
27 weeks and over	8.9	13.6	9.0	9.2	8.7	8.3	8.6
Median duration, in weeks	5.5	8.9	5.6	5.8	5.5	5.6	5.4

There was also a slight decline (both absolute and relative) among unemployed persons who left their last job and those who reentered the labor force and an even larger drop among the unemployed who were looking for their first job. The latter two categories reflect both the smaller population of teenagers (who make up most of the new entrant group) and their labor force declines, as well as the overall slowing of labor force growth during 1979.

Data on labor turnover rates in manufacturing generally support the trends cited above. Layoffs, for instance, occurred at a rate about 50 percent higher during the second half of 1979 than a year earlier. Concurrently, the rate of new hires declined slightly.

Duration. The duration of unemployment also can be a cyclical indicator; historically, movements in the median duration of unemployment have closely paralleled the overall unemployment rate. However, changes in the components of duration—that is, in the levels of short- and long-term unemployment—may be subject to different interpretations, depending on movements of other job market indicators.

The median duration of unemployment was 5.4 weeks in the fourth quarter of 1979, a small drop from 1978. A slightly larger proportion of the total unemployed were short-term unemployed (less than 15 weeks) than a year earlier. Often, this trend reflects improvements in the job market; however, early in an economic downturn, it may reflect an increase in recent layoffs and, thus, might precede a period of increasing duration. As noted earlier, data on reasons for unemployment lend support to this interpretation.

Men tend to experience a longer period of job search than do either women or teenagers. In the fourth quarter, the median duration for these three groups was 6.5, 5.5, and 4.4 weeks. One explanation for the relatively short spells of unemployment for women and teenagers is that these groups are more likely to terminate a period of joblessness by withdrawing from the labor force, at least temporarily, to devote more time to school or family responsibilities.

Jobseekers. About 8 of 10 unemployed persons were looking for full-time work in late 1979, an increase of several percentage points from a year earlier. About 9 of 10 jobless men, 8 of 10 jobless women, and 6 of 10 teenagers cited a preference for full-time work. Unemployment rates have always been lower among those seeking full-time work than among those seeking part-time jobs. In late 1979, the rates were 5.4 and 8.5 percent. Those looking for part-time work tend to be disproportionately young people and women; with greater propensity for frequent movements into and out of the labor force, these groups tend to have higher rates of unemployment than do adult men. Interestingly, the unemployment rate for adult men looking for part-time work is slightly higher than that for women. This can be explained by the predominance of younger persons among male part-time jobseekers, as the vast majority of prime working-age unemployed men seek full-time jobs. Unemployment rates for full-time workers tend to rise faster during a downturn than do those for part-time workers, since the most cyclically sensitive industries, such as manufacturing and construction, provide primarily full-time jobs.

Insured unemployed. Initial unemployment compensation claims during the last quarter of 1979 were about 400,000 per week (seasonally adjusted), 60,000 higher than during the same period of 1978. About 2.6 million persons claimed benefits, 300,000 more than in 1978. The number of unemployment compensation recipients as a percent of covered employment stayed at about 3 percent throughout 1979. During the 1974–75 recession, weekly initial claims rose as high as 570,000 a week, and claimants reached a peak of 4.7 million persons.

Status of blacks and Hispanics

Black employment growth slows. Employment among blacks[8] grew more slowly in 1979 than during each of the previous 2 years. Their over-the-year increase in employment was about 200,000, or 2.2 percent, compared with approximately 4.5 and 6.0 percent in 1977 and 1978. Employment among whites had been growing less rapidly than employment among blacks since the 1974–75 recession and continued this pattern in 1979, increas-

[1] These data refer only to blacks. According to the 1970 Decennial Census, they account for about 89 percent of the "black and other" population group.

ing by only 2.0 percent. The ratio of employment to population edged up slightly only for whites. As shown in the following tabulation, the ratio for blacks had not regained its prerecession level by the end of 1979 (seasonally adjusted data for fourth quarter):

	White	*Black*
1973	58.6	55.0
1974	57.9	52.2
1975	56.7	49.9
1976	57.7	50.8
1977	59.3	51.9
1978	60.5	54.0
1979	60.8	53.9

Black adults experienced modest employment advances over the year, while the employment of black teenagers edged down. (See table 5.) Part of the teenage reduction can be traced to a slight decline in population, but a more important factor was a drop in their labor force participation. The number of unemployed black teens was about unchanged in 1979, so that similar reductions occurred in their labor force and employment level.

Overall, the level of unemployment among blacks changed little in 1979. Similarly, their jobless rate was fairly stable, remaining in the range of 12.0–12.4 percent for each quarter. The rate for black teenagers was unchanged; the rates for black women and men also showed almost no change. The jobless rates for whites followed a similar pattern of very small movements. Blacks experienced somewhat longer periods of joblessness than did whites; the median duration of unemployment at yearend for nonwhites was 7.1 weeks, compared with 5.0 weeks for whites.[9]

The ratio of black-to-white unemployment rates remained at about 2.4-to-1 in 1979. An even larger differential existed between the rates for black teenagers and white teenagers. The unemployment rates for both groups of teenagers rose during the last recession, but only the rate for whites declined perceptibly during the recovery period. Although blacks appeared to be starting to benefit from an improving job market in 1978, the relatively stagnant labor market situation throughout the economy in 1979 resulted in no further gains.

Job gains for Hispanics. The job situation for persons of Hispanic origin improved slightly in 1979. The annual average labor force participation rate in 1979 was 63.5 percent, compared with 62.8 percent in the previous year. Additionally, the unemployment rate moved from 9.1 to 8.3 percent on an annual basis, while employment advanced by 240,000 to 4.6 million. (Persons of Hispanic origin represent about 1 in 20 workers, nationwide.)

Unemployment rates for adult Hispanic men (5.7 percent), women (8.9 percent), and teens (19.1 percent) fell between the corresponding rates for whites and blacks. Among Hispanics, persons of Puerto Rican origin experienced the highest rate of joblessness, 13.2 percent; persons of Mexican and Cuban origin had unemployment rates of about 8 percent. About two-thirds of the working-age persons of Mexican and Cuban origin were in the labor force in 1979, while only slightly more than one-half of all persons of Puerto Rican origin participated in the labor force.

The occupational distribution of Hispanics was similar to that for blacks in that both groups were underrepresented in the higher skilled, particularly white-collar, occupations. A smaller proportion of Hispanics than black workers were employed in blue-collar occupations. (See table 6.)

Table 6. Employment of whites, blacks, and persons of Hispanic origin, by occupational group, 1979 annual averages

[Numbers in thousands]

Occupation	Total[1]	White	Black[1]	Hispanic origin
Employed	96,945	86,025	9,160	4,604
Percent distribution:	100.0	100.0	100.0	100.0
White-collar workers	50.9	52.5	35.2	32.6
Professional and technical	15.5	15.9	10.5	7.6
Managers and administrators, except farm	10.8	11.6	4.6	6.0
Sales workers	6.4	6.8	2.4	3.9
Clerical workers	18.2	18.2	17.6	15.1
Blue-collar workers	33.1	32.6	38.4	47.3
Craft and kindred workers	13.3	13.8	9.6	13.9
Operatives, except transport	11.3	10.8	15.4	21.5
Transport equipment operatives	3.7	3.6	5.3	4.0
Nonfarm laborers	4.8	4.5	8.1	7.8
Service workers	13.2	12.0	24.3	16.3
Private household workers	1.1	0.8	3.8	1.5
Other service workers	12.1	11.1	20.5	14.8
Farmworkers	2.8	2.9	2.1	3.8

[1] Detail by race and ethnicity do not add to employment total because races other than white or black are included only in the total, and because most persons of Hispanic origin are also included in the data for whites.

NOTE: Percent distribution may not add to 100.0 percent because of rounding.

Table 7. Civilian labor force participation rates by sex and age, selected years, 1949 to 1979 annual averages

Sex and age	1949	1954	1959	1964	1969	1974	1979
Both sexes, 16 years and over	58.9	58.8	59.3	58.7	60.1	61.2	63.7
16 to 19 years	52.2	48.3	46.7	44.5	49.5	54.9	58.1
20 to 24 years	64.9	61.6	64.3	66.3	68.2	74.0	77.6

55 years and over	69.5	65.8	61.7	57.4	56.1	50.7	46.7
Women, 16 years and over	33.1	34.6	37.1	38.7	42.7	45.6	51.0
16 to 19 years	42.4	39.4	38.2	37.1	43.3	49.2	54.5
20 to 24 years	45.0	45.1	45.1	49.4	56.7	63.0	69.1
25 to 54 years	35.7	38.7	42.4	44.5	49.1	53.8	62.2
55 years and over	18.0	19.7	23.1	24.3	25.5	23.0	23.2

Persons in and out of the labor force

The overall civilian labor force for persons age 16 and over grew by 2.2 million in 1979, to 103.7 million persons. Over the previous 3 years, however, labor force growth had averaged 2.9 million. Adult women made up two-thirds of the labor force growth; the teenage labor force declined by about 100,000, due, in part, to a drop in population.

Labor force participation rates—the percentage of the civilian population that is employed or unemployed—provide the clearest picture of labor force movements for specific groups, because the rates account for changes in population levels as well as absolute labor force changes. The overall participation rate was 63.8 percent in the fourth quarter of 1979, three-tenths of a point below a year earlier.

Over the past 3 decades, participation rates for women of all ages have increased dramatically, with their overall rate moving from slightly above 30 percent in the late 1940's to more than 50 percent in the late 1970's. (See table 7.) Among the major influences on rising participation rates have been a lowering of the birth rate; increases in age at first marriage; a desire to maintain or increase the household's standard of living and the effect of inflation on a family's buying power; growth in those industries (particularly the service sector) and occupations which traditionally employ women; and, of course, the growing social acceptance of work for women. Until the latter half of the 1970's, there also had been a protracted decline in labor force participation of men. This drop had been concentrated in the oldest age groups and had resulted almost exclusively from the improved financial ability of men to retire at an earlier age. This ability to retire was partially related to the increased labor force activity of wives, who provided either additional income or retirement benefits to support the labor force withdrawal of their husbands.

The labor force participation rate for adult women had advanced a percentage point a year for each of the previous 6 years and followed this pattern again in 1979, increasing from 50 to 51 percent. The greatest gains were registered by women 35 to 44 years, whose rate increased from 62 to almost 65 percent. No significant gains were shown for women over age 55. Conflicting forces have affected the recent labor market decision of these women. Improved social security, private pension and disability benefits may have allowed some working women to retire earlier than had previously been possible. On the other hand, the increased social acceptability of work for women, the recent amendments to the Age Discrimination in Employment Act, and, perhaps most importantly, the recent high rates of inflation and economic uncertainty have all worked to induce older women to remain in, or to reenter, the labor force.

The overall labor force participation rate for adult men, 79.6 percent at yearend, was 0.2 point below that of a year earlier and has remained at about that level for 4 years. (During the same period, the rate for adult women rose almost 5 points.) The rates for prime working-age men—those 25 to 54 years of age—were virtually unchanged over the year; however, rates for older men declined slightly following 2 years of little movement. While the one point over-the-year decline for older men might have been unexpected in view of the recent high rates of inflation and legislation protecting workers from age discrimination through age 70, it is too early to conclude that 1979 began a return to the groups' long-term trend of labor force decline.

The number of persons outside of the labor force—that is, neither working nor looking for work—grew by slightly less than 500,000 over the year to 58.8 million, following 2 years of declines which totaled about 0.8 million persons. There was an increase of 470,000 in the number of adult men outside the labor force, a 50,000-decline in the number of adult women in this

Table 8. Job desire of persons outside the labor force, by sex, 1979 annual averages

[Numbers in thousands]

Labor force status	Total	Men	Women
Civilian noninstitutional population, 16 years and over	161,532	76,449	85,083
Civilian labor force	102,908	59,517	43,391
Not in labor force	58,623	16,931	41,692
Do not want job now	53,328	15,248	38,079
Current activity (percent distribution)	100.0	100.0	100.0
Going to school	11.2	19.5	7.8
Ill, disabled	8.5	16.1	5.5
Keeping house	54.4	1.9	75.4
Retired	18.6	49.0	6.4
Other	7.3	13.5	4.9
Want a job now	5,293	1,682	3,613
Reason not looking (percent distribution)	100.0	100.0	100.0
School attendance	27.0	42.6	19.7
Ill health, disability	14.0	19.7	11.4
Home responsibilities	23.4	2.6	34.3
Think cannot get job	14.2	16.6	13.1
Job-market factors	9.4	5.9	4.2
Personal factors	4.7	10.6	8.9
Other reasons	21.4	18.4	21.6

status, and no change in the number of teenagers. In each of the past 4 years, the number of women outside the labor force declined while the number of men grew by a total of about 1.4 million. (See table 8.)

More than 90 percent of the persons classified as not in the labor force did not want a job. The majority of them were women who cited housekeeping duties as their major nonwork activity; most of the others were students, retirees, and the ill or disabled. Among the 5.3 million persons who said that they would like a job "now," most cited school attendance, ill health, or home responsibilities as the factors which keep them from looking for work. At the end of 1979, about 740,000 persons were not looking for work because they felt they would be unable to find a job. These "discouraged workers" are not classified as unemployed because they do not meet the labor market test of having searched for work during the month prior to the Current Population Survey. Typically, about a third of them cite personal factors such as age or lack of education as the reason they feel they would not be able to find work; the remainder cite job market factors. The size of the latter group tends to respond to cyclical pressures, while the former usually shows little cyclical movement. ☐

FOOTNOTES

[1] Except where noted, labor force, employment, and unemployment data in this article were derived from the Current Population Survey (CPS), a monthly survey of about 56,000 households conducted by the Bureau of the Census for the Bureau of Labor Statistics. As most analysis in this article is on a quarterly basis, "yearend" and "late 1979" refer to the fourth quarter. Over-the-year changes in employment and labor force for 1978 were adjusted to take account of the January 1978 revisions to the CPS estimates. All over-the-year comparisons are calculated from unadjusted quarterly averages, although all *numbers* cited for a quarter are seasonally adjusted. Over-the-year changes for 1978 cannot be calculated directly from the tables provided; see "Revisions in the Current Population Survey in January 1978," *Employment and Earnings*, February 1978, pp. 7–10.

[2] In this article, the term "adult" refers to persons age 20 and over.

[3] Data on nonfarm payroll employment, hours of work, and earnings are based on payroll reports from a sample of establishments which together employ more than 30 million workers. The data reflect March 1978 benchmark levels and seasonal adjustment revisions instituted in September 1979 for all seasonally-adjusted series since January 1974. For an explanation of these changes, see "BLS estimates revised to March 1978 benchmark levels," *Employment and Earnings*, October 1979, p. 7–13.

[4] Based on U.S. Department of Commerce's preliminary data on consumer expenditures for the fourth quarter of 1979.

[5] For purposes of this analysis, full-time employment includes all jobholders on full-time schedules. Part-time employment consists of voluntary part-time workers and persons working part time for economic reasons.

[6] For a discussion of part-time workers in terms of the probability of their part-time status in relation to socioeconomic and labor market influences, see R. W. Bednarzik, *A micro model of labor supply for part-time workers using matched CPS data*, Staff Paper 10 (Bureau of Labor Statistics, 1979).

[7] These data on parttimers refer only to nonfarm part-time employment for economic reasons.

[8] This section deals only with blacks; they account for about 89 percent of the "black and other" population group, according to the 1970 Decennial Census. The employment-population ratios in this section were calculated using civilian noninstitutional population levels, as quarterly total noninstitutional population levels are not available for blacks.

[9] Data on duration of unemployment are available only for the "black and other" group.

Industrial relations in 1979: inflation still holds spotlight

Voluntary 7-percent ceiling on wage increases loses labor support as price surge continues, but unions agree to help Administration devise new anti-inflation program; Meany steps down; worker safety and anti-bias efforts pressed

GEORGE RUBEN

Inflation continued to be a major concern of Americans in 1979. Workers experienced a loss of purchasing power as prices rose at an even faster rate than in 1978.

Late in 1978, the Carter Administration had adopted a plan to restrain wage and price increases through the voluntary cooperation of labor and management. It called for a 7-percent ceiling on price and wage increases. But with the Consumer Price Index rising at an annual rate exceeding 13 percent in the fall of 1979, the Administration tried a new approach. The Government and organized labor signed a "national accord," under which a board composed of representatives of labor, management, and the public would advise the President on anti-inflation actions, including a new wage guideline.

Employment continued to grow in 1979, but there were major layoffs in the steel and automobile industries, with Chrysler Corp. facing bankruptcy. Unemployment also increased in the construction industry, as the Federal Reserve Board tightened credit, sending interest rates to record highs.

Collective bargaining activity was heavy in 1979 as settlements were negotiated in a number of major industries. The unions generally focused on obtaining more money for their members by pressing for larger "set" wage increases or more liberal wage escalator clauses.

In the automobile industry, another major goal of the Auto Workers was to win larger pensions for current and future retirees to counter the erosion of purchasing power that had occurred since the industry last bargained on pensions in 1973. In the trucking talks, the Teamsters also sought substantial increases in employer payments in order to maintain employee benefit plans.

The most significant development in union affairs was the change in leadership of the AFL-CIO, as George Meany retired and Lane Kirkland succeeded him. (A report on the AFL-CIO convention appears on pp. 58-62.) Meany's decision, announced on September 28, ended months of speculation that centered on the deteriorating health of the 85-year-old leader. Meany had headed the federation since its formation in 1955. Lane Kirkland, whom Meany nominated, indicated that he would follow the same general policies as Meany. There also was continuing turmoil involving the United Mine Workers, and there were several important union mergers.

Developments in occupational safety and health included new court rulings on workplace standards established by the Department of Labor's Occupational Safety and Health Administration to protect employees.

George Ruben is co-editor of *Current Wage Developments*, a monthly publication of the Bureau of Labor Statistics.

There also were important developments in the area of equal employment opportunities, as two of the Nation's largest retailers were involved in disputes with the Federal Government over their employment practices.

The Department of Labor also issued an important ruling permitting greater diversifications of pension fund investments, which now total about $250 billion.

Union wage increases

For the first 9 months of 1979, settlements involving 1,000 workers or more provided for first-year wage adjustments that averaged 7.5 percent, compared with 7.6 percent for all 1978 settlements.[1] Total wage adjustments (excluding cost-of-living increases) averaged 6.1 percent when converted to an annual rate, compared with 6.4 percent for 1978 settlements.

As expected, the 1979 settlements that did not contain cost-of-living escalator (COLA) clauses generally provided for larger specified wage increases than those that did. First-year negotiated wage adjustments in contracts without COLA provisions averaged 9.1 percent, compared with 6.3 percent for contracts with such clauses. For 1978, the figures were 8.0 and 6.9 percent. When specified wage adjustments are averaged over the life of the contract, the annual rates were 4.6 percent for contracts with COLA clauses and 8.1 percent for those without, compared with 5.3 and 7.1 percent in 1978.

When benefits are combined with wages (in settlements for 5,000 workers or more) the average adjustment was 9.1 percent in the first contract year and 6.7 percent a year over the contract term, compared with 8.4 and 6.3 percent in 1978. Settlements that included COLA clauses provided for wage and benefit increases averaging 8.6 percent for the first year and 6.0 percent a year over the contract term, compared with 10.2 and 8.2 percent for those without COLA clauses. For the full year 1978, the figures for settlements with COLA provisions were 6.7 for the first year and 5.3 a year over the term and the figures for those that did not provide for COLA clauses were 9.6 for the first year and 7.2 a year over the term.

The major settlements during the first 9 months of 1979 covered 2.6 million workers in 414 bargaining units in the private nonfarm sector. The settlements did not result in any increase in the number of workers covered by COLA provisions, partly because 1.5 million of the workers involved in the bargaining already were covered by COLA clauses. The eight settlements (for 15,700 workers) that established COLA clauses and the seven settlements (for 82,500 workers) that terminated clauses brought the total coverage to 5.5 million or 59 percent of the 9.4 million workers in bargaining units of 1,000 or more.

During the first 11 months of 1979, labor-management disputes led to about 5,100 work stoppages, involving about 1.9 million workers. This was about the same as during the same period of 1977, but higher than in 1978. There were 33.1 million days of idleness, or 0.16 percent of the estimated working time, compared with 35.6 million (0.18 percent) and 30.8 (0.16 percent) in the corresponding periods of 1978 and 1977. These data cover work stoppages involving six workers or more and lasting a full day or shift or longer.

Anti-inflation program

The general 7-percent wage guideline and other provisions of the voluntary anti-inflation plan President Carter announced in October 1978 were revised at the end of that year. Alfred Kahn, chairman of the Council on Wage and Price Stability, said the changes were triggered by complaints from business and labor that the standards were too rigid. The revisions in wage guidelines—

—exempted any cost increases needed to maintain existing levels of pension benefits from counting toward the 7-percent guideline limit for annual increases in compensation;

—specified that only the first 7 percent of any increase in health insurance premiums required to maintain benefits would count toward the guideline;

—exempted from the guideline any increases in labor costs required to comply with Federal statutes;

—suspended the 7-percent guideline when necessary to counter specific labor shortages; and

—revised the methods of assessing compensation increases for nonunion workers to make it similar to that for union-represented workers.

The President's proposal to provide "real-wage insurance" for employees who conform to the 7-percent guideline encountered resistance in Congress, as the House Ways and Means Committee ended March hearings on the proposal without reporting out a bill. The proposal, which was generally opposed by organized labor, was not presented for reconsideration later in 1979.

In February, the General Accounting Office, the investigative arm of Congress, declared that it would be illegal for the Administration to withhold Federal purchase contracts from firms that failed to comply with the wage and price guidelines. The Administration nevertheless initiated the requirement for all contracts worth $5 million or more, beginning February 15, and subsequently won a court test in which the AFL-CIO and some member unions challenged the legality of the sanctions.

The first major test of the wage guidelines came in January, when the Oil, Chemical and Atomic Workers settled with the major petroleum refiners for 60,000 employees. The parties and the Council on Wage and Price Stability agreed that the 2-year contract met the guidelines but the union late in the year announced that it would not be bound by the guidelines when the contract was reopened in January 1980.

In April, the Teamsters settled with the trucking industry on a 3-year contract. Alfred Kahn, chairman of the Council, said that the accord met the guideline limit of 7 percent a year for increases in compensation, but the parties valued it at about 10 percent a year.[2]

In June, the Council announced that a settlement between United Airlines and the International Association of Machinists was in "probable noncompliance" with the wage guidelines. The 3-year agreement, which was valued at 35 percent over the term by United, was subsequently upheld by the Council, which approved an "undue hardship" exception to the guidelines based on company data indicating that "adherence to the pay standard would seriously have threatened the financial viability of the company."

Mid-year settlements with the major rubber companies also were questioned by the Council but were later approved after the firms agreed to offset the excess part of the increase in compensation by restraining their profits.

In August, the Council began soliciting union and management views on its proposals for changes in the anti-inflation plan to become effective October 1, the beginning of the second year of the plan. In a policy shift, the AFL-CIO indicated that it could live with voluntary guidelines if they underwent a "wholesale revamping" that would loosen the wage standard and clamp down on prices. It proposed the formation of a committee from labor, business, and the general public which would establish and modify pay guidelines in accord with the "broad concept that wage increases should be based upon changes in the Consumer Price Index, plus changes in the long-term rate of increase in manufacturing productivity." The Federation also suggested the creation of a committee of consumer, business, and public representatives to oversee price increases.

This led to negotiations between the Administration and the AFL-CIO, the Auto Workers, and the Teamsters that resulted in a national accord aimed at fighting inflation. In conjunction with the accord, which was announced on September 28, the parties also agreed on the establishment of a 15-member (later increased to 18) Pay Advisory Committee with equal representation from the general public, labor, and business to "provide public participation and advice to the Council on Wage and Price Stability on encouraging anti-inflationary pay behavior by private industry, employers, and labor."[3]

The national accord committed the parties to support fiscal restraints; "countercyclical" actions to alleviate the effects of a downturn in the economy; reduced dependence on petroleum (particularly from foreign producers), increased U.S. exports, and prompt assistance to American workers displaced by imports; and continued efforts to assure safe living and working conditions.

AFL-CIO Secretary-Treasurer Lane Kirkland headed the labor team that negotiated the accord with the Administration. The accord was approved by the AFL-CIO's Executive Council and by the Teamsters and Auto Workers unions.

Although the President was delaying his decision on pay guidelines until the Pay Advisory Committee formulated its recommendations, there was one immediate change. In October, the Council ruled that employees whose wages are not subject to wage escalator adjustments could receive up to 8 percent increases in compensation during the second year of the program, if they had not exceeded the 7-percent standard during the preceding 12 months. The Council on Wage and Price Stability estimated that the 8-percent guideline would apply to 78 million nonunion employees and 12 million represented by unions but not covered by COLA clauses.

In November, the Council informed General Motors Corp. and Ford Motor Co. that their settlements with the Auto Workers were in probable noncompliance with the guidelines. Chairman Kahn said that even with the most liberal (low) assessment, the contracts were several percentage points above the 22.5-percent guideline for a 3-year period. The Council later approved the GM accord, after the company agreed to conform to the price limitations. Talks between the Council and Ford continued into 1980.

The less costly accord at Chrysler Corp. also was questioned by Kahn but he subsequently indicated that the agreement would not have to be renegotiated to meet the guidelines. Despite this, bargaining was reopened at year end to comply with a legislated requirement that the cost of the UAW settlement be cut an additional $243 million before Chrysler could receive Federal aid. (The resulting January 6 settlement provided for further delays of general wage increases and a still lower number of paid personal holidays than at GM and Ford.)

Bargaining issues

Wages. The unions' drive for large wage increases in 1979 settlements was generally accomplished by winning larger specified wage increases or more liberal wage escalator clauses. Contracts that provided for more liberal escalator clauses usually provided for specified wage increases similar to those in the just-expired contracts. The liberalizations of COLA clauses usually took the form of reducing the amount of movement in the Consumer Price Index required to trigger an escalator adjustment but a few settlements increased the frequency of possible adjustments or eliminated restrictions on the size of adjustments.

The Rubber Workers' 3-year settlements with the various rubber manufacturers provided for quarterly escalator adjustments at the rate of 1 cent an hour for each 0.26 point movement in the CPI-W (1967=100), beginning in the second year. The later settlements between the Auto Workers and General Motors Corp., Ford Motor Co., and Chrysler Corp. also provided for a formula of 1 cent for each 0.26 point movement but the auto accords continued to call for use of a 1967=100 composite index derived from the U.S. and Canadian government indexes. Another difference was that the escalator formula in rubber provided for "advances" of 20 cents at the beginning of the first year and 15 cents at the beginning of the second and third years. However, 5 cents was to be withheld from some regular quarterly adjustments to offset the advances. Unlike the rubber contracts, the auto agreements provided for the permanent diversion of a total of 14 cents from quarterly COLA adjustments to help meet the cost of the settlements.

The rubber contracts provided for a total of 72 cents an hour in "set" general wage increases and an additional 40 cents for skilled workers. Under their 1976 agreements, workers received $1.35 in general increases plus 40 cents to skilled workers, and 93 cents in COLA adjustments. The new auto agreements provided for general wage increases of 3 percent plus 24 cents an hour, effective immediately, and 3 percent on both the first and second anniversaries. This matched the general increases in the 1976 contract, except that it provided for an initial increase of 3 percent plus 20 cents. COLA adjustments totaled $1.37 during the 1976 contracts.

In the trucking industry, the 3-year settlement between the Teamsters and Trucking Management, Inc., and other employer groups provided for continuation of the COLA formula of 1 cent an hour for each 0.3 point movement in the CPI-W (1967=100) but adjustments were to be made semiannually instead of annually. An unusual feature of the new COLA clause provided that the final semiannual adjustment will be effective on April 1, 1982, the day after the contract expires. As a result, that adjustment will apparently count as part of the cost of the 1982 settlement, rather than the 1979 settlement, for determining conformity with wage guidelines.

The 1979 trucking accord provided for a total of $1.50 an hour in set wage increases, compared with $1.65 under the 1976 settlement. COLA adjustments totaled 62 cents under the 1976 contract.

In the electrical equipment industry, settlements between various unions and the General Electric Co. and Westinghouse Electric Corp. provided for semiannual adjustments of 1 cent an hour for each 0.2 percent movement in the index; previously, employees received annual adjustments of 1 cent for each 0.3 percent movement in the index during the preceding 12 months, with no credit for that portion of the rise between 7 and 9 percent.

Specified wage increases in the new contracts totaled 82.5 cents an hour, compared with about $1.10 under the 1976 contracts, which also resulted in 50 cents in COLA adjustments.

In the airlines industry, settlements negotiated by the Machinists union with United Airlines, Inc., TWA, and other companies generally reduced the movement in the CPI required for a COLA adjustment but continued to limit the maximum size of the adjustments. At United, for example, the 3-year contract provided for three annual adjustments of up to 13 cents an hour each, calculated at 1 cent an hour for each 0.3 point rise in the index; the previous formula provided for three annual adjustments of 1 cent an hour for each 0.4 point movement, up to 12 cents a year, which was the amount employees actually received.

One industry that retained the same escalator clause was meatpacking. The settlements between the United Food and Commercial Workers and John Morrell & Co., Wilson Foods Corp., George Hormel & Co. and other companies provided for continuation of semiannual escalator adjustments calculated at 1 cent an hour for each 0.3 point movement in the CPI-W (1967=100). These firms, which have been facing problems of plant obsolescence and intense competition from new companies using new processing and distribution methods, also settled for the same total of set wage increases as in the 1976 contracts—60 cents an hour over three years. COLA adjustments totaled $1.50 an hour in the 1976 contracts.

Two other major industries that settled in 1979 continued their practice of not using a COLA clause. In petroleum refining, the Oil, Chemical and Atomic Workers and the various companies partly countered the problem of forecasting future price movements by again limiting their agreements to a 2-year term. In addition, they agreed to a relatively large set wage increase of 73 cents an hour at the beginning of the agreements and agreed to reopen bargaining at midterm on the possibility of raising the 5-percent deferred wage increase scheduled for that time, as well as on improving certain benefits.

The prior agreements in this industry, negotiated in 1977, provided for a 9-percent initial wage increase and a 75 cents-an-hour increase at mid-term.

Automatic COLA clauses also were not adopted in Ladies Garment Workers settlements for 250,000 employees of outerwear manufacturers. The contracts did continue to provide for reopening bargaining on wages if the CPI rises a specified amount (an unspecified amount, in some contracts) but the union has not initiated such reopenings in recent years because of the generally unfavorable financial condition of the industry. These contracts provided for set wage increases of 5-, 5-, 8-, and 7-percent over the 3-year term, compared with 5-, 5-, 7-, and 6-percent during the previous contracts.

Pensions and other issues. Although wages drew the most attention in 1979 bargaining, other issues also were important and usually reflected union attempts to counter inflation.

In the trucking industry, employers agreed to increase their financing of pension and insurance plans by $30 a week to maintain existing levels of benefits. The Teamsters union was one of the leaders in the successful effort to persuade the Council on Wage and Price Stability to exclude part of the increase in employer insurance financing and all of the increase in pension financing from counting toward guideline calculations in cases where the additional money was needed to maintain existing benefits. The union claimed that if all such costs were counted toward the value of a settlement package that met the guidelines, there would be no money left for wage increases and other benefits.

In the automobile industry, pensions were a particularly important issue, as the Auto Workers sought to win benefit increases to offset the reduction in purchasing power since the 1973 pension agreement. Originally, the union sought a system under which benefits would be adjusted according to the movement of the CPI but it later settled for a multi-step increase for current and future retirees over the 3-year contract term. (The number of steps was less at Chrysler, but the final benefit levels were to match those at General Motors and Ford.)

Another important issue in this industry was the number of paid personal holidays, which was increased to 26 over the 3-year term, compared with 12 during the last 2 years of the prior contract. (Chrysler employees were to receive a total of 20 such holidays under their October accord, but the number was reduced to three as a result of the January 6 modifications.) This was another step toward the union's goal of a 4-day workweek. The increase in paid personal holidays, combined with other paid time off, also tends to moderate layoffs in the industry, which exceeded 100,000 workers in December.

In the electrical equipment industry, financing of pensions was a major issue in the 6-week strike against Westinghouse Electric Corp. by several unions. The company had pressed for conversion to a contributory pension plan contending that this was necessary to bring its labor costs into line with those at the General Electric Co., which had a contributory plan. The company later withdrew this demand and benefit rates were increased, but not to the same levels as at GE, where the employee contribution was increased.

An unusual new contract provision negotiated in 1979 was a Ladies Garment Workers "tax" on imported garments. Under the provision, intended to stem a loss of jobs resulting from increased imports, employers will be required to pay the union an amount equal to 1.5 percent of the cost of garments purchased abroad.

Previously, the ILGWU had the right to seek "liquidated damages" in such cases, which amounted to as much as 25 percent of the cost. However, the union used this penalty selectively, because it could have wiped out employers of its own members. The ILGWU indicated that the new tax will be applied equally, not selectively, and that any resulting money will be used primarily for its union label campaign.

In the rubber settlements, the Rubber Workers won assurances (except from Goodyear) that the companies would not interfere with union efforts to organize new plants. The union has been experiencing difficulty in organizing the plants, particularly those in areas where other industries usually are not organized.

Representation of workers at new plants also was an issue in the Auto Workers negotiations with General Motors, as the company agreed to permit UAW members in its employ to transfer to new GM plants with full seniority, if the new plant manufactures items that are similar to those in plants where the UAW holds representation rights. Previously, such transfers were permitted only when the opening of new plants resulted in layoffs at existing UAW plants.

In a related matter, GM agreed to be neutral in any UAW effort to organize its plants, ending a dispute that flared up at the start of the negotiations.

Government salaries

The California Supreme Court declared invalid a State law that had, in effect, precluded any salary increases for local government workers. The law was enacted in 1978 to help counter the drop in revenue resulting from Proposition 13, the Statewide initiative that rolled back levels of property taxes and restricted future increases. The law had provided for the distribution of surplus State tax funds to affected local units only if salary increases for their employees during the fiscal year were held at or below the increase for State employees. State employees did not receive an increase, which meant that these local employees also could not receive an increase. Employee organizations had charged that local government units had violated valid contracts by failing to pay scheduled increases.

As a result of the ruling, hundreds of thousands of local government workers received retroactive pay increases and they were also free to bargain on current or future increases.

State employees received a 1978 increase, after all, as the legislature in July 1979 enacted a two-part salary increase for them—14.5 percent effective July 1, 1979, and 7 percent retroactive to October 1978.

At the Federal level, 1.4 million white-collar employees and 2.1 million members of the Armed Forces received a 7-percent salary increase in October. (Federal employees are not permitted to bargain on salaries and benefits, but white-collar and blue-collar workers may join unions and bargain on working conditions and other matters.) Early in the year, President Carter had indicated that he would propose a 5.5-percent increase to Congress but later decided the larger increase was warranted because of the higher rate of inflation.

Members of Congress were automatically eligible for the 7-percent increase, but they turned it down and put into effect a 5.5-percent increase they had declined in 1978. Federal judges and various officials also received the 5.5-percent increase.

Pay rates for the 530,000 trades workers are adjusted at various times during the year based on comparisons with comparable occupations in the private economy. However, special legislation and a Presidential order limit their increase to 7 percent during the fiscal year that began October 1.

Other union developments

One of the challenges facing the new leaders of the AFL-CIO, and leaders of individual unions, was indicated by BLS figures which showed that union members comprised 26.6 percent of the nonfarm workforce in 1977, down from 28.5 percent in 1975. The number of union members actually increased during the 2-year period, to 22.8 million, but this was more than offset by an 8-percent increase in nonfarm employment, to 85.8 million.

In the complex 4-year contest between the Teamsters union and the Government over management of the Central States Pension Fund, the trustees voted to draw up a list of charges against Equitable Life Assurance Society of the United States and Victor Palmieri & Co., the two current managers of the fund; this action came immediately after the trustees had almost voted to fire the firms. The list of charges was to be presented to the Department of Labor, which had in 1977 successfully pressed for the resignation of the trustees then in control and for the hiring of the firms. The trustees' October 1979 decision came in the midst of a continuing series of court cases over operation of the fund, including six cases in the Chicago Federal District Court alone.

The United Mine Workers union continued to be beset by difficulties, internal and external. Its chief of staff resigned after only 3 months of service, claiming he was hampered by conflicts with other officials. Women coal miners accused some union members and mine owners of discriminatory job actions. The union encountered new setbacks in its efforts to organize new or expanding mines in the West and Appalachia. The Consolidation Coal Co. withdrew from the Bituminous Coal Operators Association, indicating it would bargain with the UMW on an individual basis. Also, the steel company members of the association were pressing for a larger role in bargaining.

In November, UMW President Arnold Miller resigned, after his third heart attack. The executive board designated Miller president emeritus and selected Vice President Sam Church to fill the remaining 2 years of Miller's term.

Among union mergers:

—The Retail Clerks and the Meat Cutters unions joined to form the United Food and Commercial Workers, the largest union in the AFL-CIO. William W. Wynn, who had been president of the Retail Clerks, was elected to head the new union.

—The Lathers union affiliated with the Carpenters, in a move to expand job opportunities and reduce jurisdictional disputes.

—The Auto Workers gained 50,000 members when the Distributive Workers affiliated with the UAW.

Equal employment opportunity

The year was marked by a number of major administrative, judicial, and legislative developments involving efforts to erase job discrimination.

The Federal Government found the American Telephone and Telegraph Co. to be operating in compliance with the antibias provisions of a 1973 consent decree and joined the company in persuading the Federal District Court in Philadelphia to let the decree lapse. The Government's analysis showed that AT&T had made significant progress in a number of areas, including the hiring and promotion of women, blacks, and Hispanics.

In February, the Equal Employment Opportunity Commission announced that it had reduced its backlog of discrimination cases to 119,000. Eleanor Holmes Norton, head of the Commission, which is responsible for enforcing antidiscrimination provisions of Title VII of the Civil Rights Act of 1964 in private industry and Federal agencies, noted that when the drive to reduce the backlog began in January 1978, there were 135,000 cases on file and that 75,000 cases had been added in subsequent months. Norton indicated that the case reduction process centered on—

—Assigning new cases to investigators instead of clerks and by scheduling conciliation meetings between employer and employees within 30 days.

—If the parties do not accept the agency's settlement within 60 days after proposal, the case is referred to commission headquarters for a decision on whether to initiate a court action.

Norton said that as the backlog of cases is eliminated, the commission will be shifting its focus from individual cases to situations dealing with broad patterns of discrimination.

Sears, Roebuck and Co. charged that the Federal Government's various equal employment laws conflict and were impossible to comply with and that the Government's own policies have resulted in a work force dominated by white men. The Sears action was apparently prompted by the EEOC's January decision to terminate 6 years of negotiations with the retailer on its employment practices.

In May, Federal District Judge June L. Green dismissed the Sears claim because it was "not sufficiently concrete."

This ruling was still in the appeal process when the EEOC filed five separate actions against Sears in which it charged the company with discriminating against women in recruitment, hiring, training, promotions, and pay around the Nation, and against blacks and Hispanics in some regions.

The EEOC also filed a suit against Montgomery Ward and Co., charging that the company's store in Glendale, Ariz., paid female department heads less than male department managers with the same responsibility. The EEOC also asserted that the company has violated a 1976 agreement with the Department of Labor in which it promised to equalize pay for men and women in equal jobs in all of its 2,200 stores.

In another development, the Department of Labor announced that Uniroyal Inc. had agreed to a $5.2 million settlement of a sex discrimination dispute. The Department had barred the company from obtaining any new Government contracts because it had allegedly failed to comply with a 1965 Executive Order requiring Government contractors to cooperate in any investigations of discrimination complaints. Overall, a total of 750 past or present women employees of Uniroyal's Mishawaka, Ind., plant will share the $5.2 million. The accord also restored other benefits lost as a result of the discrimination.

The Supreme Court held that employers and unions with no proven history of discrimination can adopt quotas to overcome racial imbalances in "traditionally segregated job categories." The case was initiated by Brian F. Weber, a white worker at a Kaiser Aluminum and Chemical plant in Louisiana, who was denied admission to a special job training program in which half of the places were reserved for blacks. Weber had more seniority than some of the blacks accepted, and he therefore contended that his exclusion amounted to discrimination in violation of the Civil Rights Act of 1964. Although the law outlaws discrimination against individuals, the court ruled that Congress had not meant to forbid private employers from correcting racial imbalances caused by societal discrimination.

Occupational safety and health

The rate of occupational illnesses and injuries in the private sector in 1978 was essentially the same as in 1977, but the occupational fatality rate declined, according to Bureau of Labor Statistics' data released last year.

The number of occupational illnesses and injuries actually increased by 6 percent in 1978, but there was a rise in the number of workers and their hours on the job. As a result, the incidence rate of 9.4 injuries and illnesses per 100 full-time workers was about the same as for 1977.

Some key results of the illness and injury portion of the survey:

—There were 5.66 million work-related injuries in 1978, about the same as in 1977.

—The number of injuries involving lost worktime increased to 2.4 million, while the number of injuries that did not result in lost worktime increased by 66,000.

—About 38.2 million workdays were lost to work-related injuries, which amounted to 62.1 days for each 100 workers. The figures for 1977 were 35.2 million days, or a 60.0 rate.

—Lost-time injury rates increased in 1978 in seven of the eight industry divisions. The exception was finance, insurance, and real estate, where the rate did not change.

—The largest change in the injury incidence rate for an industry division was in construction, where the rate rose to 15.9, from 15.2 in 1977. However, the rate of lost workdays declined to 108.1 from 109.7.

—Recognized occupational illnesses totaled 143,500 in 1978 compared with 162,000 in 1977.

—Job-related deaths declined to 4,590 in 1978, from 4,760 in 1977, a decrease of 4 percent, despite a 5-percent increase in employment. In relation to hours worked, the fatality rate fell to 0.82 per 10,000 full-time workers, from 0.91 in 1977.

Leading causes of death:

—Over-the-road car and truck accidents accounted for 29 percent of fatalities, and aircraft crashes accounted for 7 percent.

—Thirteen percent of deaths resulted from falls, with one-half occurring to construction workers.

—Nine percent of the fatalities resulted from industrial vehicles and equipment accidents.

—Heart attacks accounted for 9 percent of fatalities.

—The construction industries, employing 5 percent of all workers, accounted for 20 percent of the fatalities. The services industries, representing 21 percent of all workers, accounted for only 8 percent of the deaths and nearly half of those resulted from over-the-road motor vehicle accidents or aircraft crashes.

—Of the 4,500 fatalities, nearly 500 were illness-related, primarily due to heart attacks.

The Government moved into a new area of occupational health and safety in October, when the Occupational Health and Safety Administration ordered the American Cyanamid Co. to end practices at its Willow Island, W. Va., plant that the agency claimed posed a threat to the ability of women employees to bear children. OSHA also fined the company $10,000 for violations of health and safety standards.

The problems at the plant emerged in 1978, when four women disclosed that they had been voluntarily sterilized in order to retain their jobs in the lead pigment production area. The company has admitted that it excluded women from certain work areas because exposure to chemicals might harm fetuses or affect fertility, but it also said that it offered them transfers to other jobs, possibly at lower pay.

At year-end, the company closed the plant's lead pigment department, resulting in the layoff of about 60 employees. The four women who filed the complaint were not affected.

The Federal Court of Appeals for the District of Columbia upheld OSHA's standard for employee exposure to cotton dust. OSHA had published the standard in June 1978, but it was not put into effect because of a court test by the American Textile Institute, which contended that engineering controls were too costly, that OSHA had not performed a required cost-benefit analysis, and that the agency did not have the authority to order the transfer of certain employees to less hazardous work at equal pay. Several unions also contested the standard, contending it was too lax.

Consolidating the various challenges to the standard, the appeals court ruled that the textile industry could not prove that it was protecting workers from brown lung disease through periodic physical examinations and arrangements for job transfers. The court also said that the use of individual respirators by workers was inadequate protection and even presented additional safety and health hazards.

The cotton standard provides for graduated steps toward final limits to be attained within 4 years by installation of engineering controls. The final limits are 200 micrograms of cotton dust per cubic meter of air in yarn manufacturing, 750 micrograms in slashing and weaving, and 500 micrograms in cotton waste processing, and in warehousing. Employers are permitted to furnish employees with respirators until the engineering controls are installed.

Eula Bingham, Assistant Secretary of Labor for Occupational Safety and Health, said she was pleased with the ruling because it "vindicates our regulatory approach favoring engineering controls over personal protective equipment."

There was speculation that the ruling could influence the same court's pending decision on whether the lead industry must use engineering controls to attain the standard it had already permitted OSHA to begin enforcing. Another standard, for benzene, was under review by the Supreme Court. ☐

FOOTNOTES

[1] This BLS information on the size of collective bargaining settlements is of limited use in any attempts to determine the effect of President Carter's anti-inflation plan because the BLS procedures for evaluating settlements differ from those of the Council on Wage and Price Stability, which administers the plan. Unlike the BLS, the Council:

—Includes estimates of potential cost-of-living escalator adjustments.

—Excludes increases in the cost of maintaining existing health benefits in excess of 7 percent.

—Excludes increases in the cost of maintaining existing pension benefits levels.

—Excludes the cost of legally-required social insurance programs.

One reason for the differences was that Kahn estimated future wage escalator increases based on the assumption that the CPI would rise 6 percent a year, which was the amount the guidelines program specified should be used in calculating the cost of settlements.

[2] Its specific responsibilities were to

—Submit by Oct. 31, 1979, its recommendations for (1) changes in the basic 7-percent pay standard, (2) the inflation assumption to use for evaluating automatic wage escalator contract clauses, (3) the threshold for the low-wage exemption, (4) the treatment of increments and tandem collective bargaining relationships, and (5) the proper standard for workers not covered by wage escalator clauses.

—Recommend possible changes in pay exception and noncompliance decisions of the Council on Wage and Price Stability.

—Make other recommendations and new or revised interpretations of the pay standard.

—Make recommendations to assure that individual decisions are fair and consistent with the objectives of the program.

In addition, a new Price Advisory Committee of five members from the general public was to recommend modifications of the price standard, new or revised interpretations of the price standard, and any needed changes in the anti-inflation program.

Workers' compensation laws—key amendments of 1979

All but three of the States increased temporary total disability benefits; some also sought to cut costs by investigating medical bills, offsetting benefits by other transfer payments, and reducing the effect of disabilities through rehabilitation programs

LAVERNE C. TINSLEY

The legislatures of 49 States and Puerto Rico enacted 220 amendments to workers' compensation laws during 1979. A review of these amendments indicates that States are continuing to improve benefits for covered workers, while seeking to control costs through better administration. Many States have shifted their focus from meeting the essential recommendations of the National Commission on State Workmen's Compensation Laws to dealing with other issues addressed by the commission, including rehabilitation and administration.

All but three States and Puerto Rico increased weekly payments for temporary total disability. Connecticut and Florida increased benefits across the board up to 100 percent of the State average weekly wage. (See table 1.)

Half a dozen States revised provisions for handling medical expenses. Maine and Texas strengthened disclosure requirements for health care providers, and Minnesota will establish criteria for excessive medical costs. Seven States updated rehabilitation provisions for injured workers. Minnesota and Montana now withhold benefits in whole or in part for failure to participate in such programs; Arkansas prohibited such withholding.

Florida approved a major revision of its law by incorporating a "wage loss" system for compensating permanent partial disability. In addition, watts telephone lines were authorized Statewide to facilitate communication among all parties involved in workers' compensation matters. Michigan provided that certain State employees, if victims of workplace assaults, will receive supplemental benefits that, combined with workers' compensation, could equal their full salaries.

Twenty-one States were concerned with revising coverage provisions. Ten legislatures approved amendments which exempt or provide for elective coverage of sole proprietors, partners, and corporate officers. Idaho exempted members of volunteer ski patrols; North Carolina exempted members of the Civil Air Patrol and reduced numerical exemptions from fewer than five employees to fewer than four. The remaining States primarily expanded coverage for State and emergency service personnel.

Among other jurisdictions that amended benefit provisions, Kansas raised maximum weekly benefits from 66 2/3 percent to 72 percent of the State average weekly wage. Arkansas established a three-step monetary increase from a weekly maximum of $87.50 to $112 (currently payable) to $126 by March of 1980. Arkansas, Indiana, Mississippi, Missouri, Nebraska, New

---

LaVerne C. Tinsley is a workers' compensation specialist in the Division of State Workers' Compensation Standards, Employment Standards Administration, U.S. Department of Labor.

Table 1. Jurisdictions that increased maximum weekly temporary total disability benefits during 1979[1]

Jurisdiction	Former maximum	New maximum
Alabama	$128.00	$136.00
Alaska	$607.65	$654.30
Arkansas	$ 87.50	$112.00
Colorado	$173.60	$222.74
Connecticut	$204.00, plus $10 for each dependent under 18 years of age not to exceed 75 percent of employee's wage	$222.00, plus $10 for each dependent under 18 years of age not to exceed 75 percent of employee's wage
Delaware	$154.50	$164.71
District of Columbia	$396.78	$426.26
Florida	$130.00	$195.00
Hawaii	$189.00	$200.00
Idaho	$109.80 to $164.70 according to number of dependents, plus 7 percent of SAWW for each child up to 5	$115.80 to $173.70 according to number of dependents plus 7 percent of SAWW for each child up to 5
Illinois	$329.82	$342.19
Indiana	$120.00	$130.00
Iowa	$265.00	$352.00
Kansas	$129.06	$148.00
Kentucky	$112.00	$121.00
Louisiana	$141.00	$149.00
Maine	$231.72	$306.23
Maryland	$202.00	$220.00
Massachusetts	$211.37, plus $6 for each dependent; aggregate not to exceed worker's average weekly wage	$227.31, plus $6 for each dependent; aggregate not to exceed worker's average weekly wage
Michigan	$142.00 to $171.00, according to number of dependents	$156.00 to $185.00, according to number of dependents
Minnesota	$209.00	$226.00
Mississippi	$ 91.00	$ 98.00
Missouri	$115.00	$125.00
Montana	$188.00	$198.00
Nebraska	$155.00	$180.00
Nevada	$212.02	$229.71
New Hampshire	$180.00	$195.00
New Jersey	$146.00	$156.00
New Mexico	$172.46	$186.38
New York	$180.00	$215.00
North Carolina	$178.00	$194.00
North Dakota	$180.00, plus $5 for each dependent child; aggregate not to exceed worker's net wage after taxes and social security	$196.00, plus $5 for each dependent child; aggregate not to exceed worker's net wage after taxes and social security
Ohio	$216.00	$241.00
Oklahoma	$132.00	$141.00
Oregon	$224.16	$241.70
Pennsylvania	$213.00	$227.00
Rhode Island	$183.00, plus $6 for each dependent; aggregate not to exceed 80 percent of worker's average weekly wage	$199.00, plus $6 for each dependent; aggregate not to exceed 80 percent of worker's average weekly wage
South Carolina	$172.00	$185.00
South Dakota	$155.00	$175.00
Tennessee	$100.00	$107.00
Texas	$105.00	$119.00
Utah	$197.00, plus $5 for dependent spouse and each dependent child up to 4, but not to exceed 100 percent of SAWW	$210.00, plus $5 for dependent spouse and each dependent child up to 4, but not to exceed 100 percent of SAWW
Vermont	$181.00, plus $5 for each dependent under 21 years of age	$192.00, plus $5 for each dependent under 21 years of age
Virginia	$187.00	$199.00
Washington	$175.30	$186.88
West Virginia	$224.00	$237.00
Wisconsin	$202.00	$218.00
Wyoming	$224.98	$239.59

[1] Benefit increases are based on the applicable State's average weekly wage, and for the District of Columbia, the national average weekly wage. However, 10 States (Arizona, Arkansas, California, Georgia, Indiana, Mississippi, Missouri, Nebraska, New York, and Tennessee) and Puerto Rico prescribe statutory amounts; three States (Arizona, California, and Georgia) and Puerto Rico are not listed since no increases for temporary total disability were legislated during 1979.

York, North Dakota, Tennessee, and Washington increased statutory amounts for both disability and death. Offset provisions were created or revised in Florida, Maine, North Dakota, Ohio, Oregon, Utah, and Washington. Burial allowances were increased in Nevada. Colorado equalized entitlement to compensation for residents and nonresidents; and New York and Tennessee established the same rights for widowers as those existing for widows.

Long-term recipients of workers' compensation were given increases in Nevada, North Dakota, Pennsylvania (occupational disease cases), Utah, and West Virginia.

Following is a summary of 1979 enactments by State pertaining to coverage and benefits, as well as rehabilitation, administration, and other aspects of State workers' compensation.

Alabama

Sole proprietors and partners are now permitted to elect coverage for themselves. Previously, such employers could not elect coverage for themselves for benefit purposes.

Alaska

Political subdivisions may now elect coverage for their volunteer ambulance attendants and volunteer police.

Arizona

Coverage for volunteer firefighters now includes those in both private protection squads and fire departments in unincorporated communities.

Arkansas

For coverage purposes, the definition of employee now includes full-time sole proprietors and partners. A three-step increase retroactive to March 2, 1978, will raise the maximum weekly benefits for all disabilities and for death from $87.50 to $126.00 by March 1, 1980. The maximum awards for other than both permanent total disability and death will also increase to $56,700 on March 1, 1980. The discount rate in computing lump sum settlements was increased from 4 to 7 percent. An employer's obligation for additional vocational rehabilitation expenses was limited to 60 weeks; but no employee is required to participate in a vocational rehabilitation program without his or her consent. Employers cannot be held responsible for unauthorized medical expenses.

A claimant's failure to give notice within the required 60 days does not bar a claim if the employee had no knowledge that the disability arose out of and in the course of employment. A lump sum payment of attorney fees is now permitted even if the award is to be paid in installments.

Various rules, regulations, and procedures regarding Second Injury Funds and appeals were established or revised. The employer will only be liable for the specific disability resulting from the last injury in both permanent partial and permanent total disability claims. Any principal officer, director, stockholder, or partner acting in the capacity of an employer assumes employers' exemption from liability under common law; the negligent acts of an employee cannot be imputed to the employer.

Self-insured employers are allowed to enter into pooling agreements with other employers in the same type of business. When established that failure to file a claim for compensation was induced by fraud, the claim may be filed within 1 year from the date of discovery of the fraud.

All authority related to the filing, processing, and payment of public employee claims has been transferred from the Workers' Compensation Commission to the Public Employee Claims Division of the Arkansas Insurance Department.

California

Volunteer workers for public agencies or nonprofit organizations who receive no remuneration other than meals, transportation, lodging, or reimbursement for incidental expenses are excluded from coverage, provided such persons are included under Title II of the Domestic Volunteer Service Act of 1973.

The revolving Compensation Insurance Fund was changed to a Public Enterprise Fund, which is exempt from certain State provisions. References to "widow" have been changed to "spouse" throughout the law.

Colorado

Death benefits for nonresident dependents are now the same as for resident dependents in deaths that occurred on or after July 1, 1979.

Under nonmedical treatment, chiropractic care must now be paid by self-insured employers.

A penalty of $500 or 60 days imprisonment, or both, may be assessed against any person, company, or corporation who fails to provide or maintain insurance coverage for the term of the contract when performing services on a farm or ranching operation.

Connecticut

The law was redesignated as the Workers' Compensation Act, and references to "workmen's" were changed to "workers'" throughout the law.

Elective coverage was extended to sole proprietors and business partners.

Benefits for both disability and death were increased from 85 to 100 percent of the State average weekly wage.

A 12-percent interest rate, formerly 6 percent, will be applied as additional compensation in cases where benefit payments are unduly delayed.

The number of compensation commissioners was increased from seven to eight. Appellate procedures were revised with the creation of the Compensation Review Division to hear appeals, testimony, or evidence. The Division's decision may be appealed to Superior Court.

Delaware

A Workmen's Compensation Commission was established to study workers' compensation insurance and to make recommendations for improving the law. A sum of $50,000 was appropriated to the commissioner for administrative use.

Florida

The law was renamed the Workers' Compensation Act, and references to "workmen's" were replaced by "workers'" throughout the law.

Officers of a corporation who elect to be exempt from coverage are excluded from the definition of employee. The definition of independent contractor now includes musicians and other entertainers who are not otherwise covered.

Maximum weekly benefits for both disability and death were increased from 66 2/3 percent to 100 percent of the State average weekly wage. The percentage of the employee's wage upon which benefits are based was increased from 60 to 66 2/3 percent for both temporary and permanent total disability. Payment for temporary partial disability was increased from 60 percent to 66 2/3 percent of the difference between preinjury and postinjury income. A wage loss approach for payment of permanent partial disability was established, and the scheduled payment periods for such disability eliminated.

Compensation for dependents will now be offset by the amount of any social security benefits received. The law also was changed to bar compensation for both temporary and permanent total disability when unemployment compensation is being received.

All attorney fees are now to be paid out of the claimant's award except under certain circumstances. Medical and hospital fees will be closely regulated, and peer review of medical care has been established.

The reporting procedures regarding an injury were changed. When an injury occurs, the employer is required to notify both the Division of Workers' Compensation and the employee, as well as the insurance carrier.

The penalty for a late payment of compensation was reduced from 20 to 10 percent of that payment.

Compromise and release of future medical benefits are now prohibited. Lump sum settlements cannot be considered until 6 months after the worker has reached maximum medical improvement.

The full responsibility for rehabilitation of injured workers rests with both the employer and the carrier.

The Bureau of Workmen's Compensation has been abolished and the Division of Workers' Compensation created to assume an active and forceful role in the administration of the act. Watts lines have been set up in the State to assist the resolution of workers' compensation matters.

Hawaii

A corporate officer who performs voluntary services in a corporation in which he or she is at least a 25-percent stockholder is excluded from coverage.

The State Department of Labor and Industrial Relations is authorized to set maximum employer liability for medical care and supplies using the Consumer Price Index for the Honolulu region.

A 2-year filing limit was set for benefit claims involving asbestosis or other mineral substance with carcinogenic properties. Initial judicial review of claims was changed from the State Supreme Court to the Appellate Court.

Idaho

Members of volunteer ski patrols were exempted from compulsory coverage.

Illinois

Any employee receiving compensation for work-related injuries now must be notified of his or her rights to rehabilitation care and services.

By amendment, "workmen's" was changed to "workers'" in the title and throughout the act.

Indiana

Coverage was extended to volunteer firefighters and to sole proprietors and partners actually engaged in a business.

The maximum weekly benefit for both total disability and death was raised in two steps: effective July 1, 1979, it was raised to $195; on July 1, 1980, it will increase to $210. On the same two dates, the maximum aggregate amount first changed from $60,000 to $65,000 and will increase to $70,000. The maximum number of weeks for payment of temporary total disability in conjunction with permanent partial disability was increased from 26 to 52 weeks. Replacement of prosthodontic devices is now permitted for employees with a compensable mouth injury.

Iowa

Elective coverage for police and firefighters in municipalities with populations of 8,000 or more will be permitted after December 31, 1979.

Employers are required to repair or replace artificial appliances when damaged or no longer usable as a result of work-related circumstances (other than normal wear and tear).

Kansas

The maximum weekly benefit for disability and death was raised from 66 2/3 percent to 72 percent of the State average weekly wage; the minimum weekly benefit increased from $7 to $25. The maximums for total benefits also increased: both permanent total disability and death went from $50,000 to $100,000; temporary total disability and permanent or temporary partial disability increased from $50,000 to $75,000.

Claimants are entitled to 8 percent interest on the amount of benefits found by the workers' compensation examiner or director or State court to be due and unpaid.

Louisiana

Sole proprietors and partners are now permitted to waive coverage.

The law now authorizes group self-insurance funds. Five or more employers of the same trade or business with a minimum combined net worth of $500,000 are now permitted to pool their potential liabilities.

Joint self-insurance programs are now permitted for local government employers through the formation of an interlocal risk management agency.

Maine

Coverage now includes all fire personnel whether or not they perform administrative duties.

Injured employees are now permitted to receive podiatric services from licensed podiatrists in Maine.

Occupational hearing loss is now measured in accordance with the National Standards Institute (Standard S3.22, 1976) rather than the American Standards Association (Standard Z24.5, 1951).

The Workers' Compensation Commission was authorized to enforce the provisions pertaining to interest on awards. Attorneys are prohibited from receiving payments directly from clients. The Second Injury Fund is no longer liable for any claim that exceeds its assets.

Workers' "average weekly wage, earnings or salary" was redefined to exclude any allowance given to the employee to purchase chainsaws or skidders used on the job.

All benefits, except for scheduled permanent partial disabilities and lump sum settlements, will now be offset by the amount of any concurrently received unemployment benefits.

There are new procedures to regulate the disclosure of relevant information in the insurance rate filing system.

Massachusetts

The Industrial Accident Board was newly authorized to order payment of medical and hospital bills, and reports prepared by physicians who have since died are now permitted at hearings before the Board.

Michigan

Supplemental benefits (up to full salary) are now provided to certain State employees injured as a result of workplace assaults. Carriers who pay benefits for disability or death caused by exposure to polybrominated biphenyl will now be reimbursed from the Silicosis and Dust Disease Fund.

Minnesota

Many changes were made in the workers' compensation law this year. Major changes include the following.

Business partners who own a business or farm are now permitted to elect coverage for themselves and their immediate relatives.

Death benefits can now be awarded to either surviving spouse, rather than to the widow only. Eligibility for these benefits by children has been extended to full-time students up to age 25. The 104-week limit on total disability payments has been removed. Supplementary benefit payments are increased from 60 to 65 percent of the State average weekly wage. A Reopened Case Fund has been created to assume liability for all new claims filed 7 years from the date of injury or death or 3 years from the last payment of compensation, whichever is later. The Commissioner of Labor and Industry must establish procedures for determining whether health care charges are excessive. An employee who has been mentally and physically incapacitated is now allowed to file a claim for compensation within 180 days of the incapacity. The responsibility for administration of employers' self-insurance was transferred from the Commissioner of Labor and Industry to the Commissioner of Insurance.

Employers are required to provide for both podiatric and orthodontic treatment for claimants.

A worker permanently transferred to another State is no longer covered by the extraterritoriality provision if he or she travels extensively outside that State.

The liability of an employee who intentionally or grossly caused injury to another employee was limited.

Comprehensive procedures were established for rehabilitation, emphasizing the need for comparable employment and on-the-job training. Retraining to a higher status was permitted when employability would be increased by doing so. The director of rehabilitation services, appointed by the Commissioner of Labor and Industry from persons in the Classified Service, will oversee this new program.

Mississippi

Maximum weekly compensation for disability and death was increased from $91 to $98; the total maximum was raised from $40,950 to $44,100.

Missouri

Elective coverage was allowed when an employer files notice with the Division of Workmen's Compensation. The maximum weekly benefit for temporary partial and temporary total disability was increased from $115 to $125, and the weekly compensation for both permanent total disability and death was increased from $115 to $120.

Montana

The law was redesignated the Workers' Compensation Act, and references to "workmen's" were changed to "workers'" throughout the law. The Occupational Disease Disability Act was retitled the Occupational Disease Act. The Vocational Rehabilitation Division has been renamed the Department of Social Aid Rehabilitation Services.

Municipalities must now pay the difference between a law enforcement officer's full salary and the amount of workers' compensation benefits.

The division is now authorized to require that a claimant pursue a vocational rehabilitation program, if feasible and appropriate, for continuation of benefits. Refusal to participate in the program may lead to the termination of benefits.

Full medical care without time or dollar limits was provided. Under previous law, medical treatment was restricted to a maximum of $2,500 for a nondisabling occupational disease.

Several pneumoconiosis provisions were repealed, thereby making no practical distinction between pneumoconiosis and other occupational diseases. A fine of not more than $500, up from $100, may now be assessed against an employer who fails to provide information (from books, records, and payrolls) at the request of the division. Uninsured employers are now required to pay into the Uninsured Employer's Fund either double the premium amount the employer would have paid if insured by the State fund or $200, whichever is greater. Third-party suits are no longer permitted against an employer covered by the act. State agencies are now required to be insured under the State fund. The penalty assessed against an insurer for delayed benefit payments was increased from 10 percent to 20 percent.

A provision providing employer nonliability for work contracted to an independent party was eliminated. Benefit payments are due after 15 days of an entitlement notice by the insurer.

Nebraska

The maximum weekly benefit for both disability and death was increased from $155 to $180.

Nevada

Coverage was extended to off-duty regular firefighters who perform voluntary services both within the jurisdiction served by their departments and in jurisdictions with reciprocal aid agreements.

Benefits were increased to 35 percent above the initial benefit amount for permanent total disabilities incurred prior to April 9, 1971, and for deaths prior to July 1, 1973. The burial expense allowance was increased from $1,200 to $2,500.

Cooperative agreements for rehabilitation services were authorized for the Industrial Commission, the Rehabilitation Division of the Department of Human Resources, and other agencies to provide the necessary rehabilitation services for disabled workers to return to gainful employment.

Employers are now permitted to self-insure their potential liabilities. In addition, an administrative fund was created to defray all costs and expenses of administering self-insurance programs.

New Hampshire

Death benefits for dependent and totally disabled widows or widowers will now extend for the duration of such total disability. A totally disabled widow or widower with dependent children will continue to receive supplemental compensation for their dependents according to the weekly benefit amounts until the children are no longer entitled. Lump sum agreements, except for medical care, may now be permitted at the discretion of the labor commissioner.

New Jersey

Injuries to fingers and toes will no longer be compensated unless a permanent loss of function occurs. A disfiguring injury, with scars less than three inches, will also no longer be compensable except when involving the face.

New Mexico

The definition of "workmen" was broadened to include public employees and salaried public officers.

New York

Coverage is extended to film inspection assistants, school safety supervisors, and instructors of addiction employed by school districts in a city with a population of 1 million or more.

Death benefits for either surviving spouse were equalized.

The authority of the chairman of the Workers' Compensation Board to approve rates for medical services charged to employers was extended until December 31, 1980. The board was also authorized to impose a 1½-percent monthly interest penalty for overdue payments of physician fees.

North Carolina

The law was retitled the Workers' Compensation Law, and references to "workmen's" were changed to "workers'" throughout the law.

The numerical exemption was reduced from five to four employees. Sole proprietors or partners are now permitted to elect coverage; senior members of the Civil Air Patrol were exempted.

When a totally disabled employee dies of asbestosis or silicosis, the compensation will now be the unpaid portion of the 104 weeks of disability compensation plus an additional 300 weeks of benefits.

Attorney fees in third party subrogation actions now must be approved by the Industrial Commission. Two or more employers are now permitted to pool their potential liabilities. Employers can no longer discharge or demote an employee for filing a compensation claim. When a medical bill remains unpaid after 60 days, a 10-percent penalty will now be added. The commission was also authorized to assess the costs of proceedings against any person who has brought, prosecuted, or defended such proceedings without reasonable grounds.

North Dakota

The maximum weekly benefit for death was increased from $75 to $90.

Persons on the compensation rolls as of July 1, 1975, who are continuing to receive benefits as of July 1, 1979, are now entitled to supplementary benefits. A claim for death benefits can now be filed up to 2 years (previously 1 year) following the worker's death. Court fees for cases that are being appealed are now determined by the Appellate Court, rather than by the trial judge. Temporary total and permanent total disability benefits will now be offset by the amount of any social security benefits.

Ohio

Temporary total disability benefits for the first 12 weeks of compensation will now be based on 72 percent of the employee's last full weekly wage instead of the employee's average weekly wage.

A Rehabilitation Division was established in the Industrial Commission to provide a comprehensive system designed to rehabilitate the injured worker. In the event of a concurrent and duplicative benefit under an employer-funded, nonoccupational benefits plan, temporary total disability benefits will now be reduced.

The time limit for premium defaults was changed from 6 to 8 weeks. Premium rates are now set by the Industrial Commission to assure the solvency of the State Insurance Fund.

Oregon

Upon election by a municipality, coverage can now be extended to all municipal volunteer personnel as well as to subcontractors and their employees. Mentally disabled persons in special educational training programs and participants in work training programs are now covered, except that the trainees are not entitled to temporary total disability benefits.

Compensation for permanent disability was changed from $85 to $100 for each degree of injury based on a fixed scale. Where the rating is based on permanent loss of earning capacity, the benefit value per degree is now $85.

The law was amended to limit an injured worker to four changes of his or her attending physician (following the initial choice) without approval from the director.

Self-insured employers must now have certain excess insurance to cover their potential liabilities.

The State Accident Insurance Fund was made an independent public corporation governed by five directors appointed by the Governor.

An assessment of six cents per day will now be charged to every subject employer for each worker employed each day or part of a day. Permanent total disability benefits will now be offset by the amount of social security benefits received.

Rhode Island

The Workmen's Compensation Commission was retitled the Workers' Compensation Commission.

Determinations for the reasonableness of disputed medical charges will now be made by the Workers' Compensation Commissioner.

The time period for filing occupational disease claims was extended from 24 to 36 months.

South Carolina

The amount of compensation a minor dependent may receive without the appointment of a guardian was increased from $1,000 to $2,500.

Tennessee

Maximum weekly benefits for disability or death were increased from $100 to $107, and the total maximum was raised from $40,000 to $42,800. The $15 weekly minimum remained unchanged. Death benefits payable to a widower are now the same as those payable to a widow. Lump sum payments may be commuted upon motion by any party involved in the court proceeding.

Texas

The definition of State employee was broadened to include persons paid from State funds and working for and receiving supervision from a political subdivision of the State.

Dependency no longer applies to parents who abandoned or failed to support the disabled or deceased worker during preadult years. When no claim for death benefits has been filed within 8 months of death, it will now be presumed that there are no dependents entitled to benefits; thus payments will be made into the Second Injury Fund. However, this presumption does not apply to minor beneficiaries or to beneficiaries of unsound mind for whom no guardian has been appointed. A written report must now be filed by an employer within 8 days after an employee's absence from work because of a work-related injury.

The law now requires hospitals to furnish relevant records upon request. Physicians and chiropractors were already covered by this provision.

A Workers' Compensation Advisory Committee was appointed by the Governor to study the law and to formulate possible ways to improve the system.

Utah

Minimum weekly compensation was increased from $75 to $85 for persons permanently and totally disabled and entitled to benefits from the Special Fund. References in the law to either "Special" or "Combined" Injury Fund were deemed to concern the Second Injury Fund.

Employer liability in no-dependency cases was increased from $15,600 to $18,720, payable into the Second Injury Fund. All death benefits formerly paid from the fund will now be paid by the carrier. After the first 6 years of dependency, death benefits will be subject to a 50-percent offset based on Federal social security death benefits.

The minimum weekly benefit for an employee undergoing rehabilitation was increased from $35 to $45.

Virginia

The 2-year limit for filing first or second stage pneumoconiosis claims was removed. Only in cases of pneumoconiosis or silicosis, where x-ray evidence has demonstrated a positive diagnosis of the disease, will waivers from coverage be permitted.

Requirements for group self-insurance were strengthened, with new payroll reporting procedures and the adoption of uniform rules on compliance and certification of insurance. Other insurance changes were also made.

Washington

Corporate officers were excluded from compulsory coverage; elective coverage is now permitted.

Permanent partial disability benefits (thus all disability benefits) will now be offset by any Federal social security benefits. A new provision also allows recovery of overpayment based on this offset.

Weekly compensation for scheduled injuries (where benefit amounts have been precalculated) was doubled, and total compensation for impairment to the whole body was increased from $30,000 to $60,000.

A $45,000 maximum was placed on compensation for unscheduled permanent partial disability to the back when no objective clinical findings are available.

The annual cost-of-living adjustment for both total disability and death benefits for claimants on the rolls since July 1, 1971, was extended to July 1, 1980.

West Virginia

The commissioner must now establish guidelines for determining anticipated periods of disability. Eligibility requirements under the Disabled Workmen's Relief Fund will now extend coverage to persons who receive less than 33 1/3 percent of the State average weekly wage. Payment of reasonable medical expenses is now permitted without prior authorization under certain circumstances.

A Workers' Compensation Advisory Board consisting of 10 members was created to advise the commissioner on compensation administration and make long-range plans for improvements in the Disabled Workmen's Relief Fund.

Wyoming

The presumed pay of volunteer emergency personnel was increased from $50 per month to $100 per month. Thus, they will now be entitled to maximum benefits for temporary total disability.

The dollar limits on attorney fees were eliminated. □

The cost of safety incentives

The pain and suffering of a serious disability represent a substantial portion of the costs of an injury. It would be desirable for the legal system to assign liability for such losses so that the full cost of injuries is borne by the party in the best position to prevent the accident. The dilemma, however, is that if the awards routinely made in a workers' compensation system were to be so generous as to include pain and suffering there would be a strong incentive for employees to act with less than an optimal amount of care. . . .

There is some evidence that even the more generous States within the current system may fail to encourage an appropriate amount of careful employee behavior. Only a system that provides the opportunity for detailed examination of the circumstances and consequences of the injury could avoid such a distortion of incentives; but again, this would be very costly.

Workplace Safety and Health: The Role of Workers' Compensation
(Washington, American Enterprise Institute for Public Policy Research, 1978), p. 62.

The productivity trend in the soaps and detergents industry

During 1958–77, annual productivity increased an average of 2.9 percent, as the industry responded to a strong demand for soap and detergent products and was aided by improved technology

PATRICIA S. WILDER

Productivity in the soaps and detergents industry has increased in line with the rise in output per employee hour for the manufacturing sector since 1958.[1]

While annual output doubled, employee hours increased by more than one-fourth between 1958 and 1977. The average annual increase in productivity was 2.9 percent.

The rise in productivity was associated with an annual increase in output of 4.1 percent coupled with a 1.2-percent average annual increase in employee-hours. Productivity gains have resulted primarily from sustained high levels of capital investment for new machinery and equipment, and improvements in production and packaging operations.

Output per employee hour has fluctuated during the period of this study. Since 1958, annual increases in productivity have ranged from 1.0 to 10.6 percent. Declines in productivity have occurred in 4 years, including 1977. For the most recent 5-year period, 1973–77, productivity has declined at an annual rate of 0.6 percent. (See table 1.)

From 1958 to 1965, average growth in productivity was 1.9 percent; output rose 4.6 percent, and hours advanced 2.7 percent annually. During this period, the industry experienced a general expansion. The number of establishments manufacturing soaps and detergents increased from 608 in 1958 to 704 in 1963.

From 1965 to 1974, productivity grew much faster, averaging 4.3 percent each year. The acceleration was in sharp contrast to the productivity movements of other industries in the economy. More than two-thirds of the industries for which productivity measures are available showed slackening productivity growth since 1966. Productivity growth in the soaps and detergents industry during 1965–74 reflected average annual increases of 4.9 percent in output and 0.6 percent in employee-hours. The slower growth in employee-hours was associated with an overall decline in the number of establishments—from 704 in 1963 to 642 by 1972.

In 1975, a recession year, productivity fell 7.1 percent. Output recorded its largest decline of 9.4 percent, and employee-hours declined 2.4 percent. In 1976, productivity growth resumed with a 3.0 percent gain with both output (5.8 percent) and hours (2.8 percent) increasing over the depressed levels of the preceding year. In 1977, however, output growth slowed to 2.2 percent, while employee hours increased 2.8 percent. This resulted in a 0.6-percent decline in productivity.

Output doubles

Productivity gains in the soaps and detergents industry have been closely linked to output expansion, which doubled between 1958 and 1977. Some significant factors affecting this growth are expanded use of home laundry equipment and dishwashing appliances, population growth, and successful advertising and sales promotions.[2]

Patricia S. Wilder is an economist in the Division of Industry Productivity Studies, Bureau of Labor Statistics.

Table 1. Productivity and related indexes for the soaps and detergents industry, 1958–77

[1967 = 100]

Year	Output per employee-hour			Output	Employee-hours		
	All employees	Production workers	Nonproduction workers		All employees	Production workers	Nonproduction workers
1958 . . .	77.7	78.3	76.3	64.7	83.3	82.6	84.8
1959 . . .	84.4	85.4	82.2	71.8	85.1	84.1	87.3
1960 . . .	81.7	81.5	82.0	71.9	88.0	88.2	87.7
1961 . . .	82.6	81.7	84.2	75.7	91.7	92.6	89.9
1962 . . .	83.9	81.7	89.7	78.8	93.9	96.5	87.8
1963 . . .	90.7	87.5	98.8	85.2	93.9	97.4	86.2
1964 . . .	90.7	88.3	96.5	88.7	97.8	100.4	91.9
1965 . . .	88.1	87.0	90.7	88.5	100.4	101.7	97.6
1966 . . .	94.2	94.0	94.6	93.8	99.6	99.8	99.2
1967 . . .	100.0	100.0	100.0	100.0	100.0	100.0	100.0
1968 . . .	101.1	102.4	98.2	106.0	104.8	103.5	107.9
1969 . . .	101.1	104.1	95.0	109.9	108.7	105.6	115.7
1970 . . .	105.7	110.4	96.3	115.3	109.1	104.4	119.7
1971 . . .	108.6	114.8	96.5	111.7	102.9	97.3	115.7
1972 . . .	120.0	125.1	110.1	125.9	104.9	100.6	114.3
1973 . . .	127.5	134.4	114.2	135.1	106.0	100.5	118.3
1974 . . .	132.7	139.6	119.3	137.9	103.9	98.8	115.6
1975 . . .	123.3	129.0	112.1	125.0	101.4	96.9	111.5
1976 . . .	127.0	135.0	112.0	132.3	104.2	98.0	118.1
1977 . . .	126.2	135.6	109.1	135.2	107.1	99.7	123.9
	Average annual rates of change (in percent)						
1958–77	2.9	3.4	1.9	4.1	1.2	0.7	2.1
1973–77	–0.6	–0.2	–1.5	–0.4	0.2	–0.2	1.1

The growth in output has also been influenced by the availability of a wide variety of soap and detergent products which can handle different types of cleaning problems. Among synthetic detergent products are light-duty, mild, sudsing detergents mainly used for dishwashing by hand; all-purpose and heavy-duty laundry detergents, which can be used for a number of tasks; presoak products; and automatic dishwashing detergents. Laundry soaps are also available as flakes and blown granules. The predominantly used soap product is the refined bar of toilet soap. As shoppers are aware, these bars are available in a variety of sizes, colors, and scents, some containing additives such as cold creams and deodorants. The industry is very competitive and has been able to gain public acceptance of new products through advertising, and by dispensing free samples in large numbers when new products are introduced.[3]

The growth in output has also been influenced by the interactions among the household laundry equipment, textile, and detergent industries. The development of permanent press garments in the mid–1960's by the textile industry was followed by reformulations in detergent products. Because oily soils are more difficult to remove from synthetic fibers, their increased use in clothing required improved detergent products. Also, because higher wash temperatures may cause oily soils in some synthetics to become "set," lower wash temperatures are often recommended for wash and wear garments.[4] The detergent industry developed improved products that would perform adequately at lower wash temperatures. The household laundry equipment industry followed the development of permanent press garments within a few months by the introduction of properly matched cycles in washers and dryers to handle this new concept in clothing.[5] At present, many automatic washers include permanent press cycles and various combinations of wash and rinse temperatures.

The increase in the sales of home laundering equipment, as well as the increase in wash and wear fabrics, favorably affected the demand for soap and detergent products. The output of the household laundry equipment industry is estimated to have increased nearly 70 percent between 1958 and 1976. In 1975, more than 4 million home washing machines were sold, increasing market penetration to 70 percent, from 53 percent in 1960.[6]

Employment shows moderate rise

Employment in the soaps and detergents industry, currently at 40,000, has increased moderately since 1958, when employment was at 32,000. This change is equivalent to an average increase of 1.1 percent each year. The growth in employee hours—an average annual rate of 1.2 percent—reflected a very small increase in average hours per employee.

Labor turnover in the industry has been comparatively low, providing a stable and experienced work force. Since 1958, accessions have averaged 2.5 per 100 employees annually, compared with 3.6 for all manufacturing. Separation rates have been 2.4 per 100 employees, compared with 4.1 for all manufacturing. Lower layoff and quit rates occurred in the industry than for all manufacturing almost every year. Average hourly earnings for production workers in the soaps and detergents industry have risen steadily. Hourly earnings averaged $7.81 in 1977, compared with the manufacturing average of $5.68.

The proportion of nonproduction workers in the industry is somewhat higher than is the case in other manufacturing industries—37 percent of total employment in 1977, compared with 28 percent for all manufacturing. The higher proportion reflects the larger number of professional and technical, clerical, and sales personnel employed.

Although data on the occupational composition of employees in the industry are not available, some insights can be obtained from the broader aggregation, soaps and cosmetics.[7] In 1976, an estimated 6 percent of all workers employed in soaps and cosmetics were chemical and industrial engineers, chemists, and chemical technicians. Sales and clerical personnel accounted for 26 percent of total employment. The industry also employs a large number of semi-skilled workers, such as packers, wrappers, examiners, assemblers, and mixers who accounted for 32 percent of the work force in 1976.

Larger plants dominate output

Most of the soaps and detergents industry's output is produced by large establishments. By 1972, more than 80 percent of the value of shipments was accounted for by units having 100 employees or more. These units represented only 9 percent of the industry's establishments because most of the industry's establishments are small. In 1972, 69 percent of the 642 manufacturing establishments had fewer than 20 employees.

Prior to the introduction of synthetic detergents, the soaps and detergents industry tended to concentrate near the sources of its principal raw materials. In more recent years, with increased detergent usage, more emphasis is given to locations near distribution centers when new sites are considered. Although production establishments are located throughout the Nation, about half of the industry's production originates in the North Central region of the United States.

Increases in labor productivity are frequently related to increases in the stock of capital. Over the period of this study, new capital expenditures per employee in the soaps and detergents industry increased at an average annual rate of 10 percent, compared with 7.8 percent for all manufacturing. Moreover, the levels were substantially above the average for all manufacturing in almost every year. By 1976, capital expenditures per employee were 82 percent higher than the manufacturing average ($4,191, compared with $2,300). About three-fourths of the expenditures have been for new machinery and equipment, the same as for all manufacturing.

Technology changes

Soap has always been made by combining the basic ingredients, fat and alkali. The early American commercial soapmakers made soap outdoors in large iron kettles over an open fire, according to a uniform formula. The kettle method of soapmaking was used until 1940 when a major improvement was achieved in soap production technology. A continuous process was perfected which reduced soapmaking time from about a week to less than a day.[8] Today, the continuous process is dominant, although the "kettle" process is still used in some establishments.

Soap reacts with the minerals in hard water to form lime soap, which sometimes appears as a white scum in the wash water. Synthetic detergents, however, do not react this way. The term detergent usually refers to a product, which for heavy-duty laundry use, generally contains an organic surface active agent (surfactant), an inorganic builder, and various other ingredients. Also, "detergent" is sometimes used to denote the organic surfactant.[9]

German scientists are credited with developing the first synthetic detergents during World War I.[10] Synthetic detergents were introduced into the United States during the early 1930's. The first synthetic detergents performed well in hard water; however, their cleaning ability was limited in laundry usage. In the 1940's, the discovery and development of phosphates, primarily sodium tripolyphosphate, led to the first "built" synthetic detergents which not only performed well in hard water, but provided the cleaning power necessary for laundry use.[11] By 1958, soap for many centuries the chief cleansing agent for household laundry and dishwashing use, had been largely replaced by synthetic detergents.

Detergents reformulated. Developments over the past 15 to 20 years have resulted in many changes in product composition. Because of environmental concerns, detergent products have been and are still being reformulated. One of the first changes in detergent composition occurred in 1964–65 involving the replacement of the organic surfactant with a type which degrades rapidly in the environment.[12] Specifically, "hard" branched-chain alkylbenzenesulfonate (ABS) was replaced by "soft" biodegradable linear alkylbenzenesulfonate (LAS). LAS is still a major detergent ingredient.

By the late 1960's, the focus of environmental concern shifted to phosphate levels in detergent products because of the controversy over the effect of phosphates upon rivers, streams, fish, and other wildlife. Legislation restricting phosphate levels in detergents was introduced, including a total ban on phosphate in detergents in several States. To maintain detergent performance with reduced phosphate levels, surfactant levels are generally increased. Also, the use of surfactants, which are even less sensitive to water hardness than LAS, helps to maintain cleaning performance. For this reason, surfactants based on long-chain alcohols have become more popular.

These detergent formulation changes which occurred in the mid- and late 1960's coincided with years in which productivity grew substantially less than the industry long-term average. Also, exceptionally large annual increases in nonproduction workers occurred which suggests that the industry, in response to the environmental concerns, expanded its research efforts into the development of environmentally more acceptable products.

Although sodium tripolyphosphate is still the leading detergent builder, new builders are beginning to appear and are currently used as phosphate substitutes. These include sodium carbonate, sodium silicate, and various surfactant blends. Other possible phosphate replacements are being developed and tested, but none of these materials has proved to be a total replacement on a one-to-one basis.

Production processes improved. By 1958, virtually all of the basic equipment currently used in soap and detergent making had been developed. Most of the improvements which became available later were technological refinements of the basic equipment and production processes. However, some notable improvements have been introduced.

One of the major processes in the manufacture of synthetic surfactants is sulfonation. In this process, a nonsurface-active hydrocarbon (alkylbenzene, for instance) is converted into surface-active alkylbenzenesulfonic acid, and subsequently neutralized to a salt. Oleum is the sulfonating agent.[14] In the mid-1950's, an innovation was developed which permitted the industry to convert batch sulfonation into a continuous process. With the continuous oleum process, a high-quality, uniform product could be obtained which met the important production criteria, principally light color and low free oil (unconverted hydrocarbon) in the final sulfonation product. Time saving is another advantage; the continuous sulfonation process is completed in a matter of minutes, whereas the batch process requires 6 to 10 hours.[15]

In the mid-1960's, a further improvement was introduced in the continuous sulfonation process involving a change from oleum to sulfur trioxide (SO_3) gas, mixed with air, as the sulfonating agent. The industry-wide trend towards the use of continuous SO_3 has occurred mainly because former sulfonating agents, such as oleum, have higher chemical costs, and present disposal problems of spent sulfuric acid. Also, some of the newer types of raw materials mentioned earlier cannot be processed efficiently except with SO_3. This process provides a high-quality product by minimizing product degradation due to the short reaction time, reducing costs, and realizing labor savings in the handling of the acid disposal product.[16]

Continuous sulfonation processes with automatic controls minimize labor requirements. An entire continuous sulfonation plant can be operated with one operator, rather than the two or three operators needed in the batch and semi-continuous plants.[17]

Packaging operations in the industry have long used automatic equipment. However, some technological modifications have been introduced. For example, machines have been developed to handle larger powder packs and at the same time are capable of erecting cartons, and filling and closing them at higher speeds. For liquids, machines have also been introduced that can achieve higher filling speeds.

High-speed soap bar production. Changes have also been made in soap bar finishing operations.[18] Although continuous soap production lines have been in operation for many years, the need for faster production rates and the development of more complex shapes of bar soaps spurred improvements over the past 15 years. Extensive changes have occurred in the design of the equipment and the line configurations.

New high-speed lines for production of simple or uniform type bar soap formulas have broken the traditional line speed barrier of 150-200 bars per minute. With the high-speed lines, 200-300 soap bars can be produced each minute. Modern specialty lines are available which provide flexible processing capability. A variety of toilet bar formulations such as synthetic detergent bars, soap-synthetic bars, and translucent soaps can now be produced at reasonable speeds. New high-speed stamping machines have also been developed which can produce up to 400 bars per minute either banded or bandless. In addition, refrigerated stamping dies have become standard in the industry. They serve to improve product appearance, to lessen die-fouling, and to improve production rates.

New developments have also been made in the machinery that is widely used to package bar soaps. These developments complement the development of the high-speed finishing lines and have been directed primarily toward wrappers, cartoners, and bar soap transfer units. This new equipment has the capability of attaining higher speeds and has the flexibility of handling various shapes of bar soap.[19] In the past, bar soap transfer units were limited to maximum speeds of 200 bars a minute. In the last 4 to 5 years, the speed has been increased. Wrappers, cartoners, and bar soap transfer units are being introduced that are capable of average production speeds of up to 300 bars a minute for the mass-produced soaps.

Computer technology has made possible the centralized instrumentation of the production processes, although the industry has always been highly mechanized. Computers are increasingly being used for jobs such as inventory control, flow and measurement of raw materials, formula calculations, and in mixing operations to assure uniformity of soap and detergent mixes. Marketing analysis can more easily be accomplished with computer-based information systems. The use of computer processing provides information that can be used to better allocate the time required for many activities, resulting in improved utilization of labor.

Shortrun changes in productivity in the soaps and detergents industry will continue to be affected by changes in demand. Over the longrun, the high levels of capital investment per employee should help to keep industry productivity gains in line with the average for all manufacturing.

Substantial demand for virtually all of the products produced by the industry should continue into the immediate future. The output of dishwasher detergents should especially show growth as the utilization of existing dishwashing machines is increased, and the ownership of home dishwashers is expanded. The number of washing machines in U.S. households is also expected to increase, thus generating additional growth for the soaps and detergents industry.

FOOTNOTES

[1] The soap and other detergents industry comprises establishments primarily engaged in manufacturing soap, synthetic organic detergents, inorganic alkaline detergents, or any combination thereof, and refined glycerine from vegetable and animal fats and oils. The industry is designated as number 2841 in the Office of Management and Budget's *Standard Industrial Classification Manual (SIC), 1972 edition.* Data prior to 1958 are not comparable. All average annual rates of change are based on the linear least squares trends of the logarithms of the index numbers. Extensions of the indexes will appear in the annual BLS Bulletin, *Productivity Indexes for Selected Industries.* A technical note describing the methods used to develop the indexes is available from the Division of Industry Productivity Studies.

APPENDIX: Measurement techniques and limitations

Indexes of output per employee-hour measure changes in the relation between the output of an industry and employee hours expended on that output. An index of output per employee hour is derived by dividing an index of output by an index of industry employee hours.

The preferred output index for manufacturing industries would be obtained from data on quantities of the various goods produced by the industry, each weighted (multiplied) by the employee-hours required to produce one unit of each good in some specified base period. Thus, those goods which require more labor time to produce are given more importance in the index.

In the absence of physical quantity data, the output index for the soaps and detergents industry was constructed by a deflated value technique. The value of shipments of the various product classes were adjusted for price changes by appropriate Producer Price Indexes to derive real output measures. These, in turn, were combined with employee-hour weights to derive the overall output measure. These procedures result in a final output index that is conceptually close to the preferred output measure.

The indexes of output per employee-hour relate total output to one input—labor time. The indexes do not measure the specific contribution of labor, capital, or any other single factor. Rather, they reflect the joint effect of factors such as changes in technology, capital investment, capacity utilization, plant design and layout, skill and effort of the work force, managerial ability, and labor-management relations.

Estimating the user cost of owner-occupied housing

The Bureau of Labor Statistics has continued its examination of alternative ways to measure homeowner costs in the Consumer Price Index

ROBERT GILLINGHAM

For several years, the Bureau of Labor Statistics has been studying alternative methods of measuring the costs of owner-occupied housing in the Consumer Price Index (CPI). During the recently-completed revision of the CPI, Bureau staff proposed that the housing component of the CPI—for both renters and homeowners—measure the cost of consuming the flow of shelter services provided by a house. This approach, which is comparable to that incorporated in the national accounts, focuses on consumption and abstracts from the investment aspects of home purchase decisions. Unfortunately, it is impossible to observe directly the market value of the shelter services consumed by homeowners. For this reason, it is necessary to develop *indirect* measurement techniques. The Bureau has been actively studying two alternative approaches—rental equivalence and user cost.

These alternatives, while conceptually equivalent, have substantially different operational implications. The first involves collecting rental values for houses which are rented but which have characteristics similar to owner-occupied housing and using these rents as a proxy for homeownership costs. The second involves building up the user cost of shelter services from its components—interest costs, taxes, maintenance, etc. The purpose of this article is to demonstrate that several of the conditions which characterize housing markets make the development of an operational user cost methodology extremely complex. This conclusion implies that the rental equivalence approach has a substantial operational advantage as a measure of shelter costs for homeowners.

Theoretical framework

To begin with, we take as given the overall conceptual framework for the Consumer Price Index which we have discussed elsewhere.[1] As such, we start from the proposition that the consumer's welfare is determined by the flow of consumption services received, where the services can be (1) directly provided, (2) obtained coincidentally with the consumption of a nondurable good (in which case the distinction between a good and a service is unnecessary), or (3) obtained from the use of a durable good owned by the consumer. In each case, satisfaction is derived from the act of consumption; ownership of a source of consumption services—a durable good—produces no additional satisfaction. In other words, the purchase of a durable good is an "investment," designed to provide consumption services over a future time span.

Within this framework, we want the CPI to measure over time the cost of the market basket of services *consumed* in the base period. For the services provided by directly-purchased services and nondurable goods, this implies observing market prices and transaction levels in the base period, as well as the subsequent time path of market prices. However, for the services provided by durable goods owned by consumers, the implicit

---

Robert Gillingham is chief, Division of Price and Index Number Research, Bureau of Labor Statistics.

price of the services must be estimated, because market transactions do not take place each time the service is consumed.

The remainder of this article will analyze the estimation problem involved in the case of shelter services provided by owner-occupied homes. We will start by defining user cost in the simplest case—in a world of certainty without taxes, and with perfectly competitive markets—and proceed to outline the conceptual and empirical complications which arise when these assumptions are dropped.

In a world with perfect rental and resale markets and no uncertainty, the user cost of a house in a given period can be shown to be the following:

$$(1)\ c_t = r_tP_t - A_t + Z_t$$

where r is the (single) rate of interest in period t, P is the average price of the house in period t, A is equal to the change in the average price over the period and Z represents all other cost components.[2] In other words, the user cost is defined as the opportunity cost of holding the house, $r \cdot P + Z$, less the increase in the house's value. In equilibrium, the rental price of the house, R, will be equal to the user cost, and, since we have assumed frictions away, the rent received by a landlord will equal the rent paid by a tenant. Thus, in a perfect world the following obtains

$$(2)\ R^L_t = C_t = R^T_t$$

where the superscripts L and T denote landlord and tenant, respectively.

Under the conditions we have assumed, measurement of the value of the flow of shelter services from a house becomes a trivial matter. It can be measured with information from either rental or resale and money markets and it does not matter whether the information refers to buyers' or sellers' prices. Problems arise, however, when we attempt to measure the cost of shelter for homeowners in a more complicated setting, in which the exact form of the user cost function is more difficult to define and the equalities defined above need not hold.

To lay out this problem more clearly, we will drop the assumption of perfect certainty, thereby allowing for a structure of differing asset yields. We will also relax the assumption of perfect markets to allow for the possibility that the rent received by a homeowner may be less than the rent paid by a tenant, the difference representing, for instance, the value of a management function. Although we no longer assume perfect rental markets, we do assume that there is some price at which each homeowner can rent shelter services equivalent to those provided by his own home and some strictly positive price at which another consumer would be willing to rent his house. Under these conditions, the user cost measure can be redefined as

$$(3)\ C_t = r_{et}E_t + r_{mt}M_t - A_t + Z_t$$

where M and E are mortgage and equity amounts which sum to the average price of housing (P), r_m is the mortgage interest rate, and r_e is the opportunity cost of equity capital.[3]

The relationship between user cost, defined in this manner, and the alternative rent measures defined above is now ambiguous and depends critically on the manner in which the opportunity cost of equity capital is defined. Certainly, the rent paid by a tenant (R^T) must be greater than or equal to that received by a landlord (R^L), but depending on the manner in which one chooses to define and estimate the opportunity cost of equity capital (r_e), the relationship between each of the rent measures and user cost (C) is uncertain.

The variables included in the redefined user cost function are all conceptually and operationally straightforward with one crucial exception—the opportunity cost of equity capital. Unfortunately, estimates of user cost are also sensitive to alternative definitions of this variable. Several somewhat "natural" alternatives for defining the opportunity cost of equity capital (r_e) have been suggested elsewhere.[4] In our 1973 study, it was suggested that r_e be estimated as an internal rate of return defined by the identity

$$(4)\ R^L_t + A_t = r_{et}E_t + r_{mt}M_t + Z_t$$

where R^L_t is an estimate of the market rental which an owner could receive for his house. Alternatively, one might argue that the appropriate internal rate of return be defined by substituting R^T for R^L in equation (4). In either case the resulting estimate of user cost, which we will call C_r, reduces to an implicit rent, and the following relationship holds:

$$(5)\ R^L_t \leq C_{rt} \leq R^T_t$$

The suggestion to use an internal rate of return on housing to estimate user cost is based on the assumption that this rate best describes the alternative rate of return an owner/investor could receive on another investment with similar liquidity and risk characteristics.

Several analysts have suggested that alternative rates of return which consumers either receive or pay—such as the rate of interest on consumer debt, savings accounts, mortgages and bonds—be used to construct the user cost function.[5] With this approach, depending upon the particular rates of return included, the resulting user cost estimate, which we will denote C_u, need not be bracketed by the two rent variables (R^L and R^T).

The problem of selecting an appropriate estimate of the opportunity cost of equity capital (r_e) reduces to a fundamental question concerning the appropriate treatment of liquidity and risk parameters in the user cost function: do we want to estimate the opportunity cost of equity capital using rates of return on alternative investments with similar liquidity and risk parameters? We see no reason not to estimate the cost of equity capital using rates of return on alternative investments with, in some sense, similar characteristics, provided such investment opportunities indeed exist for the homeowner. Furthermore, without accepting this basis for selecting an appropriate cost of equity capital, it is impossible to derive a single user cost of housing and, depending on the variables used to estimate user cost, the latter can fall outside the rent bounds previously defined, both in the short and long run.

It is this latter fact which adds greater weight to the argument that the internal rate of return is the appropriate measure of the opportunity cost of equity capital. It is plausible to contend that a user cost measure is a conceptually viable estimate of the value of the flow of shelter services only if it is bracketed by rent received by landlords (R^L) and that paid by tenants (R^T). It cannot be less than R^L because a homeowner always forgoes this amount when he lives in his own house, and it cannot be greater that R^T because a homeowner always has the alternative of obtaining equivalent housing services at this price. For these reasons, it can be argued that the user cost function denoted by C_u is a viable estimate of the value of shelter services only if it is bounded by R^L and R^T, and this condition will obtain in general if and only if an appropriately defined internal rate is used to estimate the opportunity cost of equity capital.

The most important conclusion to be drawn from the foregoing analysis is that unless we are able to incorporate implicit valuations of the flow of shelter services into the analysis—through the definition of R^L, R^T, and/or r_e—it is impossible to derive a measure of the user cost of housing which will be reasonably representative of the cost experience of owner/occupants. To put this conclusion another way, if we maintain that rental opportunities for owner-occupied houses do not exist, and that the rate of return of some set of financial assets is an appropriate opportunity cost of equity, then there is no reason to be surprised if our estimates of user cost exhibit wide fluctuations and include negative values—this would be an accurate reflection of user cost under the set of conditions just described. However, if, as in the analysis above, we are not willing to maintain that there are no potential rental market opportunities for owner-occupied houses, and are willing to accept the rate of return on housing investment as an acceptable opportunity cost of equity, then it is necessary to develop user cost estimates which are consistent with these propositions.

Empirical evidence

The foregoing discussion emphasizes the importance of explicit or implicit rental market information in obtaining conceptually sound user cost estimates. It might be asked, however, whether in practice use of alternative estimates of the opportunity cost of equity to homeowners might yield reasonable approximations to a user cost index which incorporates rental market information. During the recent revision of the CPI, BLS staff members experimented with alternative user cost formulations in an attempt to develop a function which would adequately represent, at a minimum, the trend in user cost without exhibiting short-term movements which are inconsistent with the framework outlined above. Using the general user cost equation, defined above as

$$(6)\ C_t = r_{et}E_t + r_{mt} - A_t + Z_t,$$

we experimented with alternative estimates of the various components—particularly the opportunity cost of equity capital (r_e) and the change in the average price of houses (A)—in an attempt to develop a user cost function which would provide a reasonable estimate of the trend in shelter cost. The basic difficulty faced is that the opportunity cost of equity capital and appreciation components in the above equation are historically volatile and, ceteris paribus, correlated. Although the measurement of house price levels, and thus appreciation, is difficult, we were able to construct reasonable estimates of current appreciation which do, in fact, accurately reflect the historical volatility of this series. Without using information from rental or housing investment markets, however, we were unable to capture the presumably correlated variation in the opportunity cost of equity capital (r_e). In other words, we were unable to estimate a user cost measure which exhibits reasonable short-term movements when current appreciation rates are included in the measure.

As a result of this empirical anomaly, our experiments were focused on developing a user cost measure which would provide a reasonable estimate of the trend movement in user cost without exhibiting the unrealistic short-term fluctuations which characterize a user cost measure which includes current appreciation rates. To do this we used (1) a moving average of past appreciation rates to estimate the trend movement in appreciation, and (2) an index of either current or a moving-average of mortgage interest rates to estimate the trend movement in the opportunity cost of equity capital.[6] It might be hoped that a user cost measure which incorporates these trend measures for both appreciation and the opportunity cost of equity would provide a more reasonable trend estimate for the user cost of housing. Furthermore, an index constructed in this fashion could be constrained to reduce unrealistic short-term volatility, characteristic of several of the alternative measures considered, which would cause severe problems in both the use and interpretation of the index.

Tables 1 and 2 summarize, very briefly, the basic findings of our analysis. These tables are based on four user cost simulations which incorporated five alternative estimates for the appreciation rate and two alternative specifications for both the opportunity cost of equity capital and the mortgage interest rate (r_e and r_m). In the first table, which uses the current mortgage interest rate to approximate opportunity cost, the impact of alternative estimates of appreciation are displayed. In the index in column 1, appreciation is estimated by applying current appreciation rates to current (constant quality) house prices. For the indexes in columns 2 through 4 one-, three- and five-year unweighted average appreciation rates are applied to current house prices, while in column 5, a 15-year weighted average of appreciation rates is incorporated.[7] Comparison of these indexes amply demonstrates the extreme impact of appreciation on the user cost measure. Even when the five-year average of appreciation is used, the index exhibits an extreme and unlikely dip in 1971–72, a dip which is only partially dampened when appreciation rates are averaged over 15 years.

Table 1. Estimated user cost indexes,[1] December 1964–December 1975

Period	Appreciation rate averaged over . . .				
	Current Period	1 year	3 years	5 years	15 years[2]
December 1964	100.0	100.0	100.0	100.0	100.0
December 1965	57.9	132.7	103.5	105.2	102.0
December 1966	53.1	117.5	121.5	115.3	115.2

December 1973	157.0	149.9	146.4	139.4
December 1974	162.6	149.4	142.9	129.9
December 1975	148.5	138.0	132.8	122.5

[1] All indexes incorporate 15-year weighted average appreciation rates. Mortgage interest rates, either averaged or current, are used for both the opportunity cost of equity capital (r_e) and the mortgage interest rate (r_m).

In table 2, which incorporates the 15 year weighted average appreciation rate for all indexes, four alternative combinations of current and average interest rates are used to represent the opportunity cost of equity capital and the mortgage interest rate. Once again, the choice of the interest rate to represent r_e and r_m has a substantial impact on the index and, especially in the case of r_e, without recourse to information from rental markets, the choice is essentially arbitrary.

The estimated user cost indexes presented in tables 1 and 2 demonstrate the sensitivity of the indexes to alternative assumptions about individual user cost components. Perhaps more importantly, they provide empirical support for the contention that it is impossible to construct a valid user cost measure which is consistent with the information provided by rent markets without either direct or, through direct measurement of the opportunity cost of equity capital, indirect use of that information. In other words, our results imply that, either directly or indirectly, a rental equivalence measure is a necessary input into the construction of a user-cost measure. Consequently, the rental equivalence approach provides a simpler, more direct measure of the cost of shelter services for homeowners. ☐

[2] See Dale Jorgenson, "The Theory of Investment Behavior," in R. Ferber, ed., Determinants of Investment Behavior (New York, National Bureau of Economic Research, 1967), pp. 129–55, for a discussion of the theoretical foundations of equation (1).

[3] In measuring the (presumably current) user cost of owner-occupied housing, one might question whether current or historical mortgage interest rates are the appropriate rate with which to measure mortgage costs. The framework developed in this paper makes it clear that this issue is not important. Because the services of a house have an (implicit) market value, this value, along with whatever mortgage rate is chosen, will determine the appropriate return on equity as a residual. Thus, ceteris paribus, higher (one might read "more current" though not necessarily) mortgage interest rates result in lower equity returns and vice versa. The choice of mortgage rate can be

governed by matters of convenience and whether one wants to distinguish equity return differences that stem from financing differences from other equity return differences.

[5] See McFadyen and Hobart, Muth, Smith, and Steiner, in the works cited.

[6] As discussed in footnote 3, the question of which mortgage interest rate to use is, at least in theory, unimportant. It is the choice of an estimate for the equity rate of return which is crucial.

[7] The 15-year weighted averaged used Koyck distributed lag weights ($\lambda = .05$).

Global shopping center

We face major changes in the world's economy. In economic policies and theories, we still act as if we lived in an "international" economy, in which separate nations are the units, dealing with one another primarily through international trade and fundamentally as different from one another in their economy as they are different in language or laws or cultural tradition. But imperceptibly there has emerged a world economy in which common information generates the same economic appetites, aspirations, and demands—cutting across national boundaries and languages and largely disregarding political ideologies as well. The world has become, in other words, *one market,* one global shopping center. Yet this world economy almost entirely lacks economic institutions; the only—though important—exception is the multinational corporation. And we are totally without economic policy and economic theory for a world economy.

A Review Essay

Beyond Keynes: European unions formulate new economic program

Elements of the prescription put forth by economists of five union groups include consensus-based decisionmaking, investment planning, price monitoring, and an incomes policy to abate Western European stagflation

EVERETT M. KASSALOW

A search is underway for a new kind of synthesis between the "old" market capitalism and a planned economy. The onset of stagflation since the 1974–75 recession has produced an almost continuous debate among economists seeking to halt inflation and to restore healthy economic growth. By and large, this debate has been dominated by two sets of prescriptions. One of these derives from what might be described as a modernized version of neoclassical economics, which has stressed reliance on the workings of the market, supply and demand, to restore a new price equilibrium. The second prescription, stemming from those who might be termed the moderate Keynesians, does not reject, in principle, government fiscal intervention to maintain full employment but seems reconciled to accepting relatively high levels of unemployment for at least several years, while market forces gradually restore an acceptable price level.

In the United States, a much smaller group, self-styled post-Keynesians, argues that major institutional changes have occurred in modern economic life that call for more positive, interventionist new policies and programs to restore full employment and to bring inflation under control. Most of these post-Keynesians reject the possibility that the market system is sufficiently competitive to restore either sustained full employment or sustained lower price levels.[1]

In Europe, a group of trade union economists has put forward an outline for a new economic program which is squarely in the tradition of Keynes but which recognizes that he, too, wrote in an era when heavy reliance on the market system may have seemed more plausible. The outline originated in a charge of the European Trade Union Confederation[2] to a working group of European union economists in November 1977 to explore "short- and medium-term economic problems." This group included representatives of five European trade union federations—the Swedish *Landsorganisationen i Sverige* (LO), the Netherlands' *Federatie Nederlandse Vakbeweging* (FNV), the British Trades Union Congress (TUC), the German *Deutscher Gewerkschaftsbund* (DGB), and the French *Confederation Francaise Democratique de Travail* (CFDT)—and a staff member of the recently established European Trade Union Confederation.

The group was chaired by Clas-Eric Odhner, chief of the Research Department of the Swedish Confederation. That department played a key role in initiating Sweden's full-employment and active labor market poli-

---

Everett M. Kassalow is the senior specialist in labor at the Library of Congress.

cies and the unions' wage solidarity program in the fifties and sixties. The study group's common outline has been issued as a report of the European Trade Union Institute.[3]

Assuming an active role

The report is intended to be a "discussion paper," not a policy statement. Yet in analyzing the current high levels of unemployment and prices and in setting forth a program to overcome both, it may foreshadow a new departure for most of European labor.[4] With a few notable exceptions, European trade unions rarely have taken a major initiative in formulating comprehensive analyses and programs for their economies. The lead in this area generally has been conceded to their "brother" socialist parties, with socialist trade unions usually providing financial and organizing electoral support on behalf of these programs. One notable exception has been Sweden, where the Federation of Trade Unions (LO) has, in the post-World-War-II era, tended to provide the analytical and programatic lead in the economic sphere for the country's Social Democratic party.[5]

The long period of almost uninterrupted economic expansion between 1950 and 1973 made this accommodation between the socialist parties and socialist trade union movements a success. An economic philosophy based on a practical marriage between an expanding welfare state and Keynesian policies, which stresses effective demand management for full employment, provided a setting in which living standards rose dramatically and unemployment was kept to consistently low levels. If inflation was at times a troublesome problem, it was nonetheless confined to what seemed to be tolerable levels, even in some Scandinavian countries where it crept as high as 6 percent in some years.

This era of sustained expansion came to an end with the severe recession of 1974–75. Since these years, most of Western Europe has been troubled with the same combination of continued high unemployment (high, at least, in comparison with the preceding two decades) and inflation more severe than boom peaks of the preceding era. In short, almost every Western European[6] country has been plagued by what has come to be known in the United States as stagflation, simultaneous high unemployment and inflation and low or no economic growth.

Theoretical warfare

The report states that the economic crisis in industrialized democratic nations (although it concentrates on Western Europe, the report refers frequently to the United States) in recent years also has been a "crisis for economic theory." Neoclassical theory has become increasingly popular, as the criticism of Keynes' theory, which was so popular in the decades after the war, mounts. Particularly prominent has been the monetarist school, which contends that the amount of money issued decides everything in economic development. Yet, according to the report, economic policies guided by such neoclassical ideas, "have plunged the industrialized world into a . . . spiral of unemployment, inflation, and stagnation." Perhaps the most obvious weakness of neoclassical theory (and its monetarist variation), argue the trade union drafters, is that it is premised on the existence of a "classic, competitive pricing mechanism," in a word, the "Market." The reality of today's world is more one of "independent price determination of companies and groups of companies dominating their markets. This applies both nationally and internationally."[7]

Corporate power. Contrary to the assumptions of conventional economics, these companies do not encounter high degrees of elasticity in the demand for their products. So, increasingly, these companies base their pricing policies on costs, with little regard for demand factors. Even most small firms producing finished products "belong to trade organizations which operate together [in fixing prices] in export markets."

The report links the pricing policies of transnational corporations, and their impact on national pricing levels. Its explanation is not entirely clear or successful, but space prevents going into this as well as some other "international" aspects of this report. With the greater dependence of their countries on foreign trade and investment than is the case of the U.S. economy, European economists tend to be more sensitive to the domestic impact on prices of these corporations' policies.

The current "depression has been so deep and persistent," in part "because governments have been too weak politically to take decisive counter measures," and "partly because many based their policies on a misunderstanding of how their economies now work." As a prime example of outmoded proposals to deal with the recent stagflation, the report cites the 1977 McCracken Report of the Organization for Economic Cooperation and Development (OECD).[8]

The McCracken group, it is alleged, has ignored the enormous power of great national and transnational corporations. Its report urges OECD governments to "refuse to accommodate" demand management to inflationary behavior by employers or trade unions which must "learn from their mistakes." This request fails to understand, charges the union report, that these relatively sheltered groups will not "bear the consequences," that many companies "are able to increase their prices with relatively small effects on sales . . . " Even when employers give way to higher wages "under union pressure," they "can always compensate themselves by means of higher prices" in the face of low elasticities of demand. Companies in weaker positions and their employees "bear the brunt of reduced overall demand." According to the trade union drafters, if the price system worked in the "idealized way envisaged" by the McCracken group, "the problems they pretend to solve could not by definition arise."[9]

Suppression of demand, then, would not mitigate inflation, inasmuch as powerful corporations take advantage of the less than full elastic demand for their products and mark up their prices to offset any loss in profit margins. "The distrust of workers and their unions in the ability of governments" to control inflation merely by trying to suppress general demand leads them to seek to offset the rising costs of living by negotiating "wage increases with inflationary consequences . . ." Similarly, their trust declines in government's ability to create jobs as general demand is restricted, and the unions thereupon struggle "to keep production and companies alive that should in fact be restructured or even abandoned." The general result is chronic stagnation.[10]

Selective intervention. The report states that the continuing high inflation rates of the 1970's are not "an unfortunate accumulation of unfavorable events (á la McCracken) . . ." Rather, they reflect great changes in the power of corporations in the economy. Therefore, "the free competition assumption is no longer a valid" basis for economic policy. While the group believes in "accepting market mechanisms when they function reasonably well . . . when there is no realistic possibility of this happening—and this increasingly is the case—there is no alternative to a government price policy and to price monitoring which should be internationally coordinated."[11]

This type of *selective* (as opposed to *general* monetary or fiscal) intervention in the economy—setting particular price and investment levels for industries or key corporations—is something of a radical departure, in peacetime, for most Western economies; but, the report argues, with the liberal-competitive system no longer a reality, a new kind of consensus approach must be substituted. There is a growing necessity for "selective measures . . . to be substituted for general measures . . . in reality the market either does not function, or its effects are politically and socially unacceptable."[12]

Sharing decisions and responsibility

The report cites "the growing demand for participation not only in political but also in economic life and decisionmaking." This participation should lead to "a better integrated and more balanced society, where responsibility will be more widely shared".[13] "Trade unions and their members are . . . offering to share responsibility for decisions, and it will be to their own peril, and to that of future society if employers turn this offer aside."[14] The union economists' heavy emphasis upon "participation" in top-level company decisions is, in part, tribute to the great influence on Europe's unions in recent years of the German Federation of Trade Unions and its advocacy of codetermination in German industrial life. Success in extending participation "will greatly improve the prospects for reaching consensus solutions to distributional conflicts."

The economists recognize that forms of participation in the control of the decisions of companies necessarily vary from country to country but caution that "in order not to make further European integration too difficult" and in order not "to complicate negotiations [for participation in decisionmaking] with" transnational corporations, "there is need to try to ensure a certain homogeneity . . ."[15]

In keeping with their retention of much of Keynesian theory, the group emphasizes that investment "determine[s] the nature of economic growth." The report states that "workers and society as a whole, and not just management, must be involved" in investment decisions. For employers to gain acceptance of the necessary "level of profits required for investments and to give companies a sound financial basis, workers will increasingly demand a say in investments and a fairer share of the income they generate." To realize the "necessary consensus required to reconcile technological and industrial dynamism with an employment-oriented investment policy," workers must have a say in investment decisions.[16]

This emphasis upon a consensus to insure adequate and correct investment decisions is a recurring theme of the report. The group argues that there is a need "to disconnect saving-investment decisions from the struggle over income distribution, by giving workers collectively a share in, and a responsibility for, both savings and investments."[17] Otherwise, the eternal bargaining struggle over the relative shares of wages versus profits can hinder a smooth flow of savings into investment and weaken prospects for economic growth.

The report here clearly supports something similar to the Swedish union proposal for workers' sharing in corporate profits, savings, and investment.[18] However, the report also stresses the consensual value and necessity for enterprise growth inherent in such a proposal.

"Disconnecting income and wealth distribution is not only motivation for a workers' partnership in the economies . . . " the report notes that Keynes never bothered about "the motivation for working," as he "wrote against a background of hard work simply being unavoidable for most people in order not to starve . . .," and this harsh competitive ethic may have been useful in the decades before today's levels of technology and productivity had been attained. Today, "productivity is only partly dependent on technology" and "to a much greater extent than is often recognized it also depends on labour relations and the degree of consensus achieved inside a company and in society at large." The old work ethic, built on fear and greed, must increasingly give way to "the creative and contributive interest that workers can have in their jobs as such" and to their "wish to contribute to participate more generally in a society characterized by cooperation, solidarity and responsibility."[19] This is one aspect of the "consensus-based" economic arrangements proposed in the report.

With the call for a participatory investment process and a monitoring system to control prices, the report does not flinch from the next logical step—the necessity for an incomes policy as part of the new economic program. In the new economic order, the trade unions "would in a negotiated consensus policy have to accept overall wage increases that were compatible with the growth of real resources and with democratically determined rates of real investment . . . " Such wage increases would have to be handled in a way that they would "not start chain reactions going beyond what was compatible with stability—though without creating rigidities which would prevent necessary long-run adaptations." Wages should be "adapted to average growth of real resources in the economy, since wages based on sector or company productivity will cause too many tensions and complementary claims." This incomes system, along with participatory investment and price-monitoring, is a "trade union way out" of the chain reactions of past wage pressures.[20]

The report reaffirms trade union support for economic growth and full employment and indeed argues that the prescription it presents is a way out of current and prospective stagnation. Such growth, however, "is not an end in itself but should have qualitative as well as quantitative aspects . . . " The emphasis upon qualitative growth includes a call for "the protection of the environment," and, while it rejects going "back to some kind of pre-industrial society, as some romantics seem to want" the group insists that the "resource problem" must be carefully considered, as "decisions on technology and investment priorities" are made. It is also suggested that there will probably be "slower growth" than in the decade before 1974.[21]

THIS EUROPEAN trade union discussion document with an outline for a prospective new economic growth program comes in a period when there is a general groping for economic policies to cope with recent stagnation. Curiously enough, even in the face of severe economic difficulties, European socialist labor forces suggest no significant turn to traditional socialist ideas in the form of socialization or nationalization of the means of production. Rather, they support an effort to find a new kind of plan that incorporates "old" and "new" ideas.[22] In its emphasis on the need for a new and wider social consensus, especially between unions and employers, the report is likely to evoke considerable echo. ☐

[1] See, for example, the first issues of the recently issued *Journal of Post-Keynesian Economics*, Vol. I, No. 1, Fall 1978, and No. 2, Winter 1978–79. There is no unity among the so-called post-Keynesians, but one important group has collectively published *A Guide to Post-Keynesian Economics* in the form of a series of articles in *Challenge Magazine*, 1978–79. This series will shortly be issued as a volume under the editorship of Professor Alfred S. Eichner, State University of New York—Purchase. A useful summary statement of some of the major precepts of this group of post-Keynesians can be found in Eichner's statement to the Special Study on Economic Change of the Joint Economic Committee of the U.S. Congress, May 9, 1979 (mimeographed—to be published in the JEC's hearings later). A more technical survey of the post-Keynesian theories is to be found in the survey prepared by Alfred S. Eichner and J. A. Kregel, "An Essay on Post-Keynesian Theory: A New Paradigm in Economics," *Journal of Economic Literature*, Vol. XIII, No. 4, Dec. 1975.

[2] The ETUC groups almost all the national union federations of Western Europe. It has a close working relationship with the European Economic Community.

[3] This institute was established in June 1978, by agreement between the European Trade Union Confederation and the Commission of the European Economic Community. The Institute will be financed principally by a 6-year contribution from the EEC, with the first year's budget set at around $615,000. The members of the ETUC executive body are also directors of this Institute, but the latter has its own staff, under the direction of Günter Köpke, formerly a staff official of the German Federation of Trade Unions (DGB), and also a former general-secretary of the European Metal Workers' Federation. The Institute is to "promote better training and information for workers and their organizations," and these are intended to contribute to the development of "an awareness of the European dimension and to improve living and working conditions in the Community." This survey of the ETUI is largely taken from a Press-Release of the EEC, dated June 6, 1978, Brussels.

[4] See European Trade Union Institute, *Keynes Plus a Participatory Economy* (ETUI-Brussels, 1979).

[5] See the important LO documents: *Trade Unions and Full Employment, Report to the LO Congress*, Stockholm, 1952; *Economic Expansion and Structural Change*, edited and translated by T. L. Johnson (London, Allen and Urwin, 1963), and the pamphlet by R. Meidner (then research director of LO) and B. Ohman, *Fifteen Years of Wage Policy* (Stockholm, 1972).

[6] A few of the smaller countries, governed usually by social democratic parties and backed by strong trade union movements, have been able to avoid any great increase in unemployment. I refer to Austria and Norway. Sweden has seemed to avoid any *official* unemployment rates, but this has been accomplished by a great increase in government training and work programs, subsidies for private production, inventory building, and so forth—all a kind of disguised unemployment. Germany and Japan have done somewhat better than other democratic industrialized countries, but even their unemployment rates have been high in comparison with the recent past.

[7] *Keynes Plus*, p. 1.

[8] *Ibid.*, pp. ii and iii. This Organization for Economic Cooperation and Development report is often referred to by the name of the chairman of its international drafting group, Paul McCracken, former chairman of the U.S. Council of Economic Advisers, and currently

professor of economics at the University of Michigan. The full title of the OECD report is, *Towards Full Employment and Price Stability*, Paris, 1977.

[9] *Ibid.*, pp. iii and 36.

[10] *Ibid.*, p. 2.

[11] *Ibid.*, p. iv. I have already noted above that the analysis of international aspects of stagflation and measures to cope with it are less effectively treated in this report. This call for international coordination remains a vague concept in the report.

[12] *Ibid.*, p. 50. The authors of the report recognize there are great administrative difficulties for governments, in undertaking selective intervention. They call for greater attention from government to help overcome inadequate administration characteristics of the past (pp. 52 – 53).

[13] The report also refers to the spillover effects and possibilities of the growth of participation into many social aspects of modern life, but I concentrate in this review on the economic aspects.

[14] *Keynes Plus*, p. ii.

[15] *Ibid.*, p. 20.

[16] *Ibid.*, p. iv.

[17] *Ibid.*, p. 56.

[18] See Rudolph Meidner, *Employee Investment Funds, An Approach to Capital Formation* (London, George Allen and Urwin, 1978) and the same author's recent update, "Employee Investment Funds and Capital Formation A Topical Issue in Swedish Politics," *Working Life in Sweden*, No. 6, June (New York, Swedish Information Service, 1978).

[19] *Keynes Plus*, pp. 57 – 55.

[20] *Ibid.*, p. 66. Collective bargaining agreements typically cover two-thirds to 90 percent of all workers in West European countries, much more than in the United States.

[21] *Ibid.*, p. 67. In part, too, growth may be slower because of the increasing shift of resources to the service sector, in most economies — a sector in which productivity "cannot really be measured." A unified, negotiated, general incomes policy "having the broad support of union members" is additionally essential to cope with the "strains on the system" which slower growth may bring. (*Ibid.*)

[22] In a recent article, one critic of European social democracy charges that the present day dilemmas of European social democracy "stem from its inherently flawed attempt to resolve the unresolvable, to construct a political program that is acceptable to both capital and labor." This effort was "valiantly and surprisingly successful" in the decades after World War II, but social democracy must become a genuine alternative "for capitalism in decline . . . for the era when social democracy could offer a harmonious vision of capitalist development is clearly past." Alan Wolfe, "Has Social Democracy a Future?" *Comparative Politics*, Vol. 11, October 1978, pp. 123 – 24. This new ETUI document would nonetheless appear to be part of a continuing search for an alternative of mixed, consensus-based economic order.

Labor force growth patterns

The evolution of the United States into a postindustrial economy in the past quarter century has been accompanied by dramatic increases in the size of the labor force. The mythology of a leisure society is giving way to the reality of a two-sex nonfamily work society.

1. While the working-age population of America increased by 46.3 percent from 1950 to 1976, the labor force increased by 52.3 percent.
2. This differential emerged despite the sharp declines in the labor force participation rates of men over the age of 65, since early retirement has become increasingly common. Indeed, the male component of the labor force did not keep pace with population growth, increasing by only 28.6 percent from 1950 to 1976.
3. In contrast, the rapid expansion of the female labor force (108.9 percent over the past twenty-six years) appears as one of the more striking trendlines of recent history. The labor force participation rate of women increased from 33.9 percent in 1950 to 47.2 percent in 1976.

The implications of this phenomenon by itself are myriad, not the least of which is reflected in the substantial increase in unemployment throughout the 1970's. Moreover, given the changing age structure of America and the rapid accession of the baby boom residuals into the labor force — as well as the unknown dimension of illegal immigration — the American economy may be severely strained to provide full employment in the very short-term future. Moreover, the competition presently facing our minority-group citizenry in this context cannot be minimized. But other repercussions are amplified as they manifest themselves within the family unit.

New directions for income transfer programs

TIMOTHY M. SMEEDING AND IRWIN GARFINKEL

Most Americans would agree that it is the responsibility of government to ensure a certain minimum level of living. Government can meet this responsibility in two ways: by providing minimum standards of income, goods, and services only for those whose incomes fall below a minimum level or by providing minimum standards for everyone, regardless of income.

The income-support system of the United States does both. Aid to Families with Dependent Children (AFDC), supplemental security income, food stamps, and medicaid are restricted to those with low incomes—they are "income-tested." Public education, social security, and unemployment compensation are available to people regardless of income—they are "non-income-tested."

Programs that are not income-tested dwarf those that are, both in total size and in the number of people they lift out of poverty. Yet, until recently, most policy analysts assumed that income testing offered the most equitable and efficient method of transferring income to the poor. Now, research, sparked by the study of economic and social behavioral response to transfers, is leading some scholars seriously to question the superiority of income-tested transfers. Many others are already convinced that welfare policy should move away from income testing and toward a more universal non-income-tested approach.

Despite their differences, the supporters of each approach agree that recent income-support policy has been characterized by piecemeal changes without any serious, general consideration given to the kind of system that is to be achieved over the long run. The debate over income testing and the research it generates present an opportunity and a framework to focus systematically on the issues facing future income-support policies and also on several specific reform proposals that have immediate policy relevance. (For example, social security, child support, and national health insurance).

The Institute for Research on Poverty held a conference last spring on future directions—income or non-income-tested—for reform of the income-support system.[1] Many of the issues discussed at that conference and other questions which have been raised in this context are summarized here.

Definition and scope of the system

The terms "income-tested" and "means-tested" signify that inability to pay for basic goods and services is necessary to qualify for a transfer. They imply, further, that transfer benefits decline as income rises. The result is that program beneficiaries face higher implicit tax rates (benefit reduction rates) on their income than do the rest of the population, for programs that confine benefits to the poor must impose a benefit reduction rate on beneficiaries that is higher than the tax rate required to finance it. In contrast, a "non-income-tested" program is one in which neither eligibility nor benefits depend on inability to pay. Benefits are provided to all regardless of income. Although income-tested programs by their nature lead to regressive tax rates in the tax-transfer system, non-income-tested programs do not assure against regressivity. Programs which provide benefits to rich and poor alike can be financed in principle by an equally regressive tax structure. Moreover, non-income-tested social insurance programs like old age, disability, and unemployment insurance impose high benefit reduction rates on earnings, and therefore, have some of the regressive features of income testing.

In determining the effects of both types of programs, we may further classify them as categorical—programs in which eligibility is limited to certain groups, such as the aged—or noncategorical.[2] Benefits under either type of program may be paid in cash or in-kind. For instance, a negative income tax (such as former President Nixon's family assistance plan) is considered a categorical, income-tested cash transfer; a credit income tax (such as Senator McGovern's 1972 demogrant plan) is a noncategorical, non-income-tested cash transfer. Another useful differentiation is between programs that fall into the category of social insurance and those that do

---

Timothy M. Smeeding is assistant professor of economics, University of Utah, and visiting project associate at the Institute for Research on Poverty, and **Irwin Garfinkel** is director of the Institute.

not. No social insurance programs are income-tested. But there are some non-income-tested programs which are not social insurance programs. For instance, free public education does not provide security against loss of income due to death, old age, or inability to work—the usual definition of social insurance—yet it is universally provided to all U.S. children, regardless of the income of their families.

The income-support system has come a long way since the debate over public education in the early part of the 19th century. Even then, the essential question was whether "free" public education should be provided only to the poor or to everyone. The 1935 Social Security Act instituted two types of programs: (1) an unemployment insurance system (UI), and a Federal social insurance system including old age insurance (OAI), later expanded to include survivors (SI) in 1938, and dependents (DI) in 1956, and finally, universal health insurance (medicare) for the elderly in 1965; and (2) a State specific welfare system for the aged, blind, and disabled (nationalized in 1974 as supplemental security income, or SSI), and for dependent children (AFDC), who in 1935 were mainly living with widows. In the 1930's, it was envisioned that the welfare system would remain rather small and unimportant, only catching those few who fell through the cracks of the social insurance system.

However, by the 1960's, welfare programs, far from withering away, had actually grown somewhat. Moreover, since the declaration of a "war on poverty" in 1965, legislative action has created a major and seemingly permanent role for income-tested transfer programs. Medicaid was born in that era and it has become our largest single welfare program; AFDC expenditures multiplied as divorce or parental desertion became increasingly common; and two types of aid to the "working poor" were first offered, in the form of an earned-income tax credit and food stamps. As the adequacy of benefits offered under welfare programs increased and coverage was expanded, more and more people were encompassed by the system.

Today, income-support payments from all sources average more than 20 percent of total household income, or about $200 billion. As a result, the incidence of poverty, as officially measured, has declined from about 22 percent in 1959 to less than 12 percent today. If in-kind transfer benefits are added to the cash incomes used to officially measure poverty, the incidence has fallen further, to about 7 percent. However, a serious poverty problem still remains, particularly for women heading families and racial minorities. About one-third of the families headed by black women, one-seventh of those headed by white women, and one-tenth of those headed by black men remain poor. Most importantly, the reduction in poverty did not occur because social programs provided a "hand up" for the poor to earn their way out of poverty. Increased transfer payments accounted for most of the progress against poverty, not increased reliance on earned income. Yet, most would agree that reliance on earned income is, in the long run, the most desirable answer to persisting poverty among those expected to work (that is, able-bodied adults, particularly those in two-parent families).

The income-support system includes more than 40 programs, covering 1 of every 4 Americans. Both the income-tested and non-income tested systems are clearly categorical. The welfare transfer system is dominated by in-kind benefits, while the social insurance transfer system is much larger, with payments mainly in cash. Currently, social insurance removes many more people from poverty than income-tested transfers, despite the fact that a larger share of income-tested expenditures is distributed to the poor.

Most Americans are dissatisfied with the transfer system. Incentives to better oneself through earnings are low, administrative costs, errors, and fraud are high, and the programs themselves are not well integrated. Increasing numbers of families are headed by divorced, deserted, or unmarried mothers. The amount of child support they receive from their absent spouses is trivial. As a result, increasing numbers of these families receive benefits from the aid to families with dependent children. Expenditures for medicare and medicaid are growing at an alarming rate. Less than half of those eligible participate in the Supplemental Security Income and food stamp programs. Because of differences in State eligibility standards and the lack of coordination among programs, many of the poor participate in several programs, while one-fifth receive no transfers at all.

Thus, reform in the welfare is beset with quandaries. Should the adequacy (and cost) of the system be increased or should costs (and adequacy) be reduced? How much emphasis should be put on work? And most importantly for the income-testing issue: should benefits be extended only to low-income families or to all families?

Issues in the income-testing debate

Work disincentive. Foremost among the issues is the effect of the current income-support system on work effort; and much of the discussion about that effect centers on tax rates. There are two types of tax rates: the explicit tax rate on taxpayers who finance the transfer and the implicit tax rates (benefit reduction rates) on transfer beneficiaries. An important finding from both experimental and cross-sectional studies[3] of labor supply is that work effort is adversely affected by marginal tax rates on earned income, whether coming from tax or from transfer programs. Moreover, groups currently aided most by the income-support system—the elderly, disabled, single-parent families, the poor, and the unemployed—were substantially more responsive to tax rates than married men who were neither old nor poor.

Given these conclusions on the impacts of tax rates, the high effective rates incorporated into the Nation's income support system take on new significance. The average benefit reduction rate in the Aid to Families with Dependent Children program is 40 percent.[4] Because AFDC beneficiaries also receive food stamps with a 25-percent tax rate, and sometimes live in public housing, where rent subsidies decrease as earnings increase, their cumulative benefit reduction rate is often nearly 70 percent. Moreover, medicaid pushes the tax rate over 100 percent for many of those whose earnings reach the point where they have to leave the welfare rolls, because loss of cash assistance often means going from no cost to full cost medical care. In other programs the story is the same. Thus, those groups whose work effort is most responsive to high tax rates confront higher combined marginal tax rates than anyone else in the economy. Indeed, the current system of income transfers penalizes the poor for working.

Economic efficiency. A closely related issue is the effect of welfare on net output and productivity. Income-testing advocates assert that income-tested programs are more efficient than non-income-tested programs. Until recently, there has been no research on the economic effects of income testing. While non-income-tested programs raise tax rates on upper income families more than do income-tested programs, they lower them on lower income families. The effects of income testing on economic efficiency, therefore, depend upon an analysis of whether it is more efficient to have higher tax rates on low- or on high-income families.

The pattern of high tax rates on groups with high propensities to substitute leisure for earnings contributes to the existing pattern of low work effort for these groups. And it runs counter to one of the most widely accepted principles of public finance theory—tax the inelastic factor. Because higher-income groups have less elastic labor supply schedules, it is possible that increases in output (that is, greater overall productivity), could be achieved and revenues held constant if tax rates were lowered for those with low earnings and raised through some form of credit income tax for those with high earnings.

This conclusion is supported by tentative results from the Seattle-Denver income maintenance experiment and other research,[5] which indicate that expanding the income-transfer system by simultaneously reducing tax rates in transfer programs and raising them in the positive tax system could lead to an increase in the gross national product. Earlier studies, based on estimates of the labor supply response of only the low-income population, found that reduced tax rates on beneficiaries increased their labor supply. However, this effect was counter-balanced by the reduction in labor supply of persons who became program beneficiaries when the lowered tax rates increased the breakeven level of income. These studies failed to account for the response of higher-income taxpayers to the increased tax rates required to finance the policy change. If tax rates on the poor are reduced, taxes and tax rates on others must be increased if net revenues are to remain constant. The new results suggest that the reductions in income from increased taxes on higher-income taxpayers stimulate an increase in their families' labor supply. These labor supply increases, together with increases of transfer beneficiaries, may actually exceed the decreases in labor supply of new beneficiaries and, hence, increase total output. Future research on the labor supply response to various income-support systems, particularly research on the labor supply response of higher income married women, will shed more light on whether it is more economically efficient to have higher tax rates on the poor or on the rich.

Administrative efficiency. The tax-transfer system places high costs on program participants, is expensive to administer, is rife with error on the part of administrators and open to fraud both on the part of transfer beneficiaries and service providers. Because the system attempts to tailor benefits or taxes to each individual's unique need or ability to pay, it fosters an erosion of the tax base in both transfer programs and the personal income tax. As a result of this erosion, marginal tax rates have been increased to maintain revenue levels, and welfare applications and tax returns have become more complex. Moreover, there is considerable deadweight loss involved in utilizing resources to avoid high tax burdens.

Proponents of a universal system point out that if income testing were removed, it would be necessary to frequently determine family status, needs, and the timing of transfer benefits for individual families. Hence, moving toward a comprehensive tax base (a move endorsed by many income-testing advocates as well) and relying on refundable personal income tax credits, coupled with a proportionate tax rate, are steps that would minimize administrative costs and incentives to alter or misrepresent incomes.[6]

Target efficiency. Target efficiency is the proportion of total benefits of a program which go to the poor. Proponents of income-tested transfers argue that for a given budget, income-tested programs deliver a larger percentage of benefits to the poor and are, therefore, more beneficial to the poor than non-income-tested programs. If the budgets available for income-tested and non-income-tested transfers are equal, income-tested programs are better for the poor. Suppose that a $5 billion surplus became available for transfer expenditures, but that larger expenditures were not politically feasible. In this circumstance, poverty is reduced most by using an income test. To forgo its use is to spread the comparatively small sum of $5 billion over such a large number of people (more than 215 million) that benefits would amount to less than $25 per person per year, and would make no dent in poverty. If the same $5 billion were expended on an income-tested program, so that only those with incomes below the poverty line benefited, the poverty gap would be cut by nearly half.

If the budgets are not equal, income-tested programs may be worse for the poor. Indeed, if the minimum payments rather than the budgets are equal, the poor are better off under non-income-tested programs. While income-testing advocates, on target efficiency grounds, have implicitly assumed that budgets are equal, advocates of non-income-tested programs argue that the wider a program spreads its benefits, the more political support it gains. Thus, non-income-tested programs provide more aid to the poor because they provide net benefits to more of the population. Current non-income-tested expenditures dwarf income-tested expenditures, but this does not mean that budgets for non-income-tested programs will become sufficiently larger than the budgets for the income-tested programs.

On a different level, proponents of a non-income-tested system argue that target efficiency is not really an efficiency measure at all but, if anything, an equity measure. A program whose impact is highly "target efficient" may be a system that is most economically inefficient because for a given budget, the more target efficient the program, the higher the benefit reduction rate and, thus, the higher the tax rate and work disincentive for beneficiaries.[7]

The choices before us

While most agree that wholesale substitution of a non-income-tested universal transfer system is not, at present, feasible, the income-testing debate is highly relevant for several current public policy debates, including aid to the elderly and female heads of households and the adoption of a national health insurance program.[8]

The elderly. The major benefit programs for the elderly are OASDI (not income-tested, but related to past earnings) and SSI (for those whose social security payments and other income are insufficient to lift them above the poverty level). However, these two programs need to be better integrated than at present. For instance, a substantial number of low-income OASDI recipients who have contributed to the Social Security system for many years, and who are also eligible for SSI, receive only $240 per year more than poor elderly persons who have made no contributions to the system at all. But should future policy efforts be directed toward expanding SSI, or toward revamping social security and better integrating it with SSI to provide a non-income-tested minimum income to all elderly people? Recent research on this issue has concluded that one cannot predict a *priori* which groups in the elderly population will benefit from income testing.[9] If guarantees are held constant, income-tested programs provide less income for the poor, and more for the rich, than do non-income-tested programs. But if earnings-replacement rates for the upper-income elderly and costs to the younger population are held constant, income-tested programs bring about higher incomes for the poor.

Single-parent families. Researchers have argued that preferential treatment of the single-parent family by the tax-transfer system, whether or not it occurs within an income-tested framework, is desirable on equity grounds because single-parent families have less earnings capacity than two-parent families.[10] But preferential treatment creates incentives for family dissolution (real or feigned). In this context, the income-testing issue can be translated into the question of whether to continue to aid single-parent families or switch to a social child-support program which reinforces the financial responsibilities of both parents, whatever their income level, but which guarantees a universal, minimum level of child payments—either publicly or parentally supported—for all single-parent families with children.

A non-income-tested, social child-support program that would, in effect, eliminate AFDC might work as follows: all single adults caring for one or more children would be eligible for a public child-support payment that would depend only on the number of children for whom care is being provided, and not on the income of the single parent. The benefit by the government would equal either some minimum amount or the amount paid by the absent spouse—whichever is larger. The payments would be financed by a tax on absent spouses equal to some proportion of their income for each child not living with them. If the tax paid by the absent spouse fell below the minimum payment, the shortfall would be financed from general revenues.

Health care. The national health insurance debate has also been subject to the income-testing issue.[11] Proponents argue that if a national program is to provide adequate health care for all at reasonable cost, it must reallocate health care services away from richer suburban families and toward poorer central city and rural residents. The current medicaid program, which limits the maximum charge for a given health care service, does not foster equal access. Because of these limits, many physicians do not participate in medicaid. Hence, a two-class medical care system which stigmatizes the poor has emerged. A national health insurance plan which extends medicaid to all low-income families would continue to separate the poor from the rest of the population. But a plan with universal coverage for all under one system would lead to more equal access and greater horizontal equity in care between high- and low-income families.

The choice between income-tested and non-income-tested policies in these and in other areas is not merely a methodological or an administrative choice. Decisions in this area will affect the future course of social policy in the United States. □

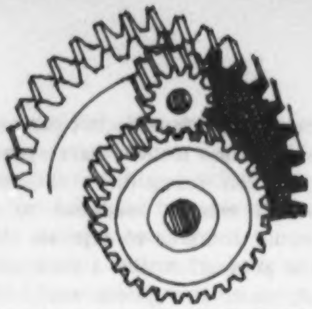
Productivity Reports



Productivity declines continue into third quarter 1979

LAWRENCE J. FULCO

The productivity decline of the first half of 1979 continued into the third quarter, showing small reductions from second quarter levels in the private business and nonfarm business sectors. This was the longest period of decline since the recession of 1973–74, when productivity declined for seven successive quarters.

Manufacturing productivity, which declined in the first quarter and increased in the second, grew even faster in the third quarter, although the gain was confined to nondurables. Among nonfinancial corporations, productivity increased for the first time this year, showing an 0.7-percent gain in the third quarter.

Three consecutive quarters of productivity decline in the private business sectors make it virtually certain that productivity will show a drop for 1979, only the second time this has occurred since 1947 when the series begins.

Chart 1 shows changes in productivity, unit labor cost, and hourly compensation in the private business, nonfarm business, manufacturing, and nonfinancial corporate sectors since 1967.

The declines in productivity this year reflected different patterns of growth in output and hours. In the third quarter, output growth resumed in the private business and nonfarm business sectors, although the declines of the second quarter were not recouped. However, manufacturing output changed little because of offsetting movements in the durable and nondurable industries.

Hours of all persons engaged in the private business sector (production and supervisory employees, proprietors and partners, and unpaid family workers) increased in the third quarter, after a small decline during the second period. Employment growth also accelerated. In the third quarter, about 79.6 million persons were engaged in private business, the most comprehensive sector for which quarterly productivity measures are prepared.

In contrast, manufacturing hours and employment declined in the third quarter in both durables and nondurables. The drop in nondurable employment and hours, coupled with the increase in sector output, resulted in the large productivity increase. About 21.3 million persons were employed in manufacturing in the third quarter; about two-fifths of them were in nondurables.

The biggest productivity increase occurred in the nondurable manufacturing sector. An 8.7-percent gain in the third quarter reflected an increase in output of 4.3 percent and a decline in hours of 4.1 percent. This was the largest productivity gain in 4 years and contributed to the first decline in unit labor cost since 1975.

The following tabulation show the annual rate of change in productivity, output, and hours for four major sectors in the economy in the third quarter of 1979:

Sector	*Productivity*	*Output*	*Hours*
Private business	-0.7	1.7	2.5
Nonfarm business	-0.7	1.9	2.6
Manufacturing	3.3	0.3	-2.9
Durable	-0.2	-2.3	-2.2
Nondurable	8.7	4.3	-4.1
Nonfinancial corporations	0.7	1.6	0.9

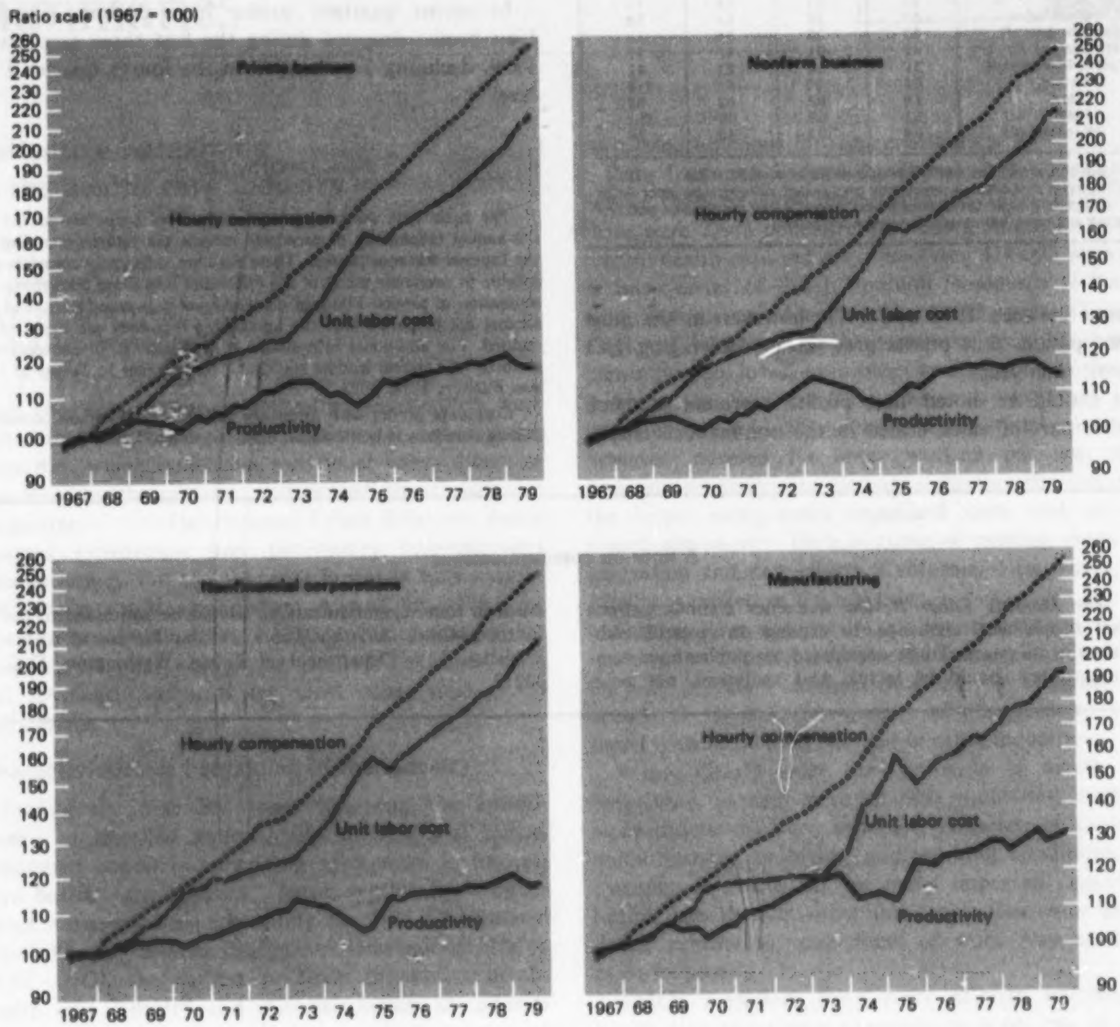
Compensation, labor cost, and profits

After rising sharply in the first two quarters, hourly compensation decelerated in the third quarter in the private business and manufacturing sectors. The reduction in the rate of increase of labor compensation combined with the slight decline in productivity and resulted in the smallest increase in unit labor cost this year. (Unit labor cost—labor compensation per unit of output—increases with gains in hourly compensation, and declines with productivity gains.) Unit labor cost rose least in manufacturing, where for nondurables, it actually showed a small decline.

Increases in the seasonally-adjusted Consumer Price Index for All Urban Consumers (CPI-U) overbalanced gains in hourly compensation in the third quarter, and real hourly compensation declined again. In the private business sector, real hourly compensation was lower than it had been since the second quarter of 1976, reflecting the more rapid advance of the CPI-U.

Lawrence J. Fulco is an economist in the Division of Productivity Research, Bureau of Labor Statistics.

Chart 1. Productivity and related measures in four major sectors in the economy, 1967-79



The U.S. Department of Commerce's Bureau of Economic Analysis prepares quarterly profit measures for the nonfinancial corporate sector.[1] This sector accounts for about 75 percent of private business output and 68 percent of labor input hours and includes all corporations doing business in the United States, except banks, stock and commodity brokers, and finance and insurance agencies. In 1978, profits[2] were about $128 billion. Output was $1,247 billion (in current dollars), of which employee compensation accounted for $835 billion and nonlabor payments—depreciation, net interest, and indirect business taxes—were $412 billion.

Profits in the nonfinancial corporate sector increased at a 5.1-percent annual rate from 1959 to 1978, somewhat faster than sector output, which grew 4.6 percent per year over the period. Thus, profits per unit of output increased 0.6 percent at the same time. This relatively modest rate of increase over the entire time-span includes subperiods of markedly different performance, as can be seen in table 1.

Unit labor costs grew faster than unit profits over the 1959–78 period, averaging 4.0 percent each year. These costs showed little movement prior to 1965, increased 4.5 percent per year between 1976 and 1973, and 7.3

Table 1. Average annual rates of change[1] in productivity, costs, and profits in the nonfinancial corporate sector

Measure	1960–78	1960–65	1965–73	1973–78
Productivity	2.1	3.7	1.8	1.4
Hourly compensation	6.1	3.6	0.4	8.8
Implicit price deflator[2]	3.7	0.5	3.6	7.6
Unit labor cost	4.0	−0.1	4.5	7.3
Unit nonlabor payments	3.2	1.6	2.1	8.2
Unit profits	0.6	3.6	−4.1	11.8
Output	4.6	6.2	4.2	3.0
Profits	5.1	9.9	0.0	15.1
Unit nonlabor cost	4.6	0.3	5.9	7.0

[1] Least-squares trend rate fitted to the logarithms of the indexes of the data.

[2] The implicit price deflator is current-dollar gross product originating in the sector divided by constant-dollar output. Current-dollar product is equal to labor compensation, profit, and nonlabor cost (mainly indirect taxes, depreciation, and interest).

percent between 1973 and 1978; however, in the most recent period, unit profits grew faster—averaging 15.1 percent each year.

It should be noted that profits represent a much smaller part of value added in the nonfinancial corporate sector than compensation. In 1978, unit profits were roughly one-seventh unit labor costs in absolute terms, in spite of the faster rate of increase of unit profits during the preceding 5 years.

In recent quarters, profits have declined steadily. Unit profits dropped during the first three quarters of 1979, declining 7 percent from the fourth quarter 1978 level. ☐

FOOTNOTES

[1] The basic data underlying the estimates of corporate profits are the annual tabulations of corporate income tax returns compiled by the Internal Revenue Service. These data are sufficiently complete and reliable to overcome many of the difficulties which are inherent in the estimation of profits. Filing of detailed returns is mandatory, and the returns are prepared with the knowledge that they are likely to be audited. For additional information, see "Readings in concepts and methods of national income statistics," Supplement to *Survey of Current Business*, 1976, p. 71.

Research Summaries

Collective bargaining in the health care industry

LUCRETIA DEWEY TANNER,
HARRIET GOLDBERG WEINSTEIN,
AND ALICE L. AHMUTY

Prior to 1974, employees of health care facilities were excluded from coverage of the National Labor Relations Act, which establishes a national policy aimed at "encouraging the practices and procedures of collective bargaining. . . . " The National Labor Relations Board asserted jurisdiction over proprietary hospitals and nursing homes, but the nonprofit hospitals were exempt until the Act was amended on August 25, 1974. The amendments, Public Law 93–360, provided that private nonprofit hospital workers be granted the same rights and privileges legislated for most other workers 39 years earlier.

Characteristics of bargaining in the industry

During the first 2½ years following the amendments, at least 44 national and international unions negotiated collective bargaining agreements in the private health care industry.[1] Three organizations dominated representation, accounting for 3 of 5 negotiated contracts: the Service Employees International Union (AFL–CIO), the earliest to begin organizing in the health care industry and now the largest in industry membership; the National Union of Hospital and Health Care Employees (District 1199), a division of the Retail, Wholesale and Department Store Union (AFL–CIO), which began representing pharmacists in New York City and now is the second largest union in the industry; and the American Nurses Association, a professional organization which took on collective bargaining functions for registered nurses.

Data from the Federal Mediation and Conciliation Service (FMCS) show that during the 1974–76 period, there were 2,585 collective bargaining situations in the private health care industry, involving 414,000 workers, or one-quarter of the 1.7 million employees of health care institutions. Most workers (85 percent) were employed in hospitals; the remainder were in nursing homes or were involved in other health care activities.

About one-third of the agreements were first contracts covering 61,000 workers. These initial contracts, however, covered far fewer workers per unit than preexisting agreements, perhaps reflecting the fact that the larger more easily organized units had already signed agreements. Both in terms of existing union organization and new efforts, California, New York, and Michigan ranked as the top three.

Shorter term agreements are more common in the health care industry than in other industries. Contracts for 1 or 2 years were most frequent; 3-year agreements accounted for only one-quarter of all contracts, compared with more than one-half in other industries.

Wages clearly were the top issue in health care bargaining, as they were in other industries; however, some differences were apparent. Duration of contract, union security problems, and working conditions, for example, appeared to be more important issues in health care than in other industries. Grievance procedures, arbitration, and hours of work also appeared more frequently.

FMCS mediators were more actively involved in health care bargaining situations as a percent of total notices than in other bargaining situations. In the majority of negotiations, however, the parties progressed towards a final settlement without the immediate threat of a strike, and may not require active mediation. When mediation did take place, nearly 50 percent more meetings were required to resolve a strike.

Provisions of the amendments

The amended law provided for some special procedures designed to promote early bargaining and avoid strikes in the health care institutions. These procedures include: (1) advance notice to the FMCS of plans to modify or terminate a contract, (2) mandatory mediation, (3) a 10-day intent-to-strike notice to the institu-

Lucretia Dewey Tanner is chief of the Division of Private Sector Manufacturing, Office of Pay Monitoring, Council on Wage and Price Stability. Harriet Goldberg Weinstein is a labor economist with the division, and Alice L. Ahmuty is a labor economist with the Congressional Research Service. This summary is adapted from their study, *Impact of the 1974 Health Care Amendments to the NLRA on Collective Bargaining in the Health Care Industry*, published in 1979 by the U.S. Department of Labor's Labor Management Services Administration and the Federal Mediation and Conciliation Service.

tion and to the FMCS, and (4) a special factfinding or Board of Inquiry (BOI) procedure to be used in cases of threatened or actual strikes.

In contract renewal or reopener bargaining, the party desiring to terminate or modify an existing contract is required to notify the other party of such intent at least 90 days prior to the expiration date, compared with the 60-day notification period established for other industries. In health care cases, FMCS must receive a written notice 60 days prior to the intent to terminate or modify the existing contract, instead of the 30-day notice requirement in other industries. In initial contract situations following certification of recognition, the labor organization requiring mediation assistance is required to give at least 30 days' written notice to FMCS that a dispute exists. Before a strike can occur in the health care industry, the union must give a 10-day intent-to-strike notice, in writing, to the institution and FMCS specifying the exact date and time the stoppage is to occur.

The BOI is designed to provide factfinding in an attempt to avoid strikes. Appointment of a BOI is at the discretion of the director of the FMCS if "a threatened or actual strike or lockout affecting a health care institution will, if permitted to occur or continue, substantially interrupt the delivery of health care in the locality concerned." The BOI is appointed for a 15-day term, during which the "findings of fact" and nonbinding recommendations are issued. Such appointment takes place no later than 30 days prior to expiration date of the contract, or within 30 days of receipt of the 60-day notice to the FMCS. In the case of initial contracts, the BOI, if convened, must be appointed within 10 days of receipt of the intent-to-strike notice.

BOI study findings

Extent of BOI involvement. For the first few months after enactment of the amendments (until November 1978), decisions to appoint a Board of Inquiry were based on a strict interpretation of the law, that is whether a strike or lockout would "substantially interrupt the delivery of health care in the locality concerned." It was found, however, that the establishment of a Board did not necessarily facilitate collective bargaining; many of the Board's reports recommended that the parties start bargaining—in some cases the parties had not even met prior to the appointment of the Board. After a few months, the FMCS determined that an additional factor should be considered prior to the appointment of a board—if the impact of a potential work stoppage was found to be substantial on the community as established by law, then a second factor, the impact on the bargaining process should be assessed.

To accommodate other provisions spelled out in the

Study update

While this survey of collective bargaining in health care institutions under the National Labor Relations Act amendments covers the first 2-½ years, nearly 3 years have elapsed since the research was concluded in December 1976 and the publication of the results. Data from the Federal Mediation and Conciliation Service (FMCS) indicate that from December 1976 to August 1979, the rate of board of inquiry appointments has actually declined, both those formerly appointed under the NLRA procedures and those agreed to by the parties in a "stipulation" apart from the explicit requirements of the act. This decline was observed between the two time periods—August 1974 through December 1976, and the most current comparable period, January 1977 to August 1979.

In the first period, 120 factfinding boards were appointed (91 under the formal procedures and 29 informally). During the intervening years, only an additional 80 boards were appointed. Each year since the first year, the numbers of appointments have been fewer.

A slower rate of appointments was noted in the original study and was predictable, as both the FMCS and the parties gained greater bargaining experience and began using the process only when such factfinding would be useful. Additionally, current data show that those FMCS regions in which factfinders were more frequently appointed initially continue to make appointments in approximately the same proportion in the more recent period.

One finding of the study was the desire of labor and management negotiators to have a preference in the selection of the factfinding board appointee. In July 1979, FMCS announced changes in its administrative rules to permit more input from the parties. Negotiators are allowed to jointly submit a list of proposed names to serve as a board member with the right to defer to a separate factfinding or arbitration procedure for resolving disputes.

Have the amendments reduced work stoppages? Unlike the decline in the number of factfinding board appointments, the incidence of strikes (in absolute numbers) increased during the most current period (129 in the first period versus 179 in the second). When viewed against the total collective bargaining activity since 1976, however, the strike rate has actually declined. From August 1974 through December 1976, a total of 2,585 bargaining situations was recorded by FMCS. From the start of 1977 to August 1979, an additional 4,705 sets of negotiations were held, an increase of 190 percent. Bargaining in the health care industry is more frequent and contracts of 2 year durations are common. This increase in collective bargaining activity is related to renegotiated contracts as well as the addition of new bargaining situations. Thus, when the total number of strikes to total collective bargaining situations in each of the two periods are compared, the rate of strike activity has actually dropped since 1976.

amendment, FMCS developed the concept of a stipulation agreement as an option to the Board of Inquiry. In cases where it is too early in the bargaining process to interpose a third-party neutral to assist in defining issues, the parties may agree, in writing, to permit the agency to appoint a factfinder at some later specified time. Then, after 30 days of bargaining have passed, FMCS reviews the state of negotiations and determines whether a factfinder is warranted.

During the first 2-½ year period, 120 boards were appointed (25 in the first 4 months), 29 of the total under the stipulation procedures. A monthly average of 90.5 health care bargaining cases were closed by the FMCS in 1975 (compared with 108.6 in 1976), while the monthly average number of Boards declined from 4.3 in 1975 to 3.7 in 1976. At the same time, health care disputes became more numerous and the appointment of Boards became more selective; thus, the percentage of Boards to total collective bargaining situations declined. More restricted use of factfinding following an initial period of heavy usage is not unique to the health care industry. Similar declines have been observed in the use of factfinding under the National Emergency Disputes of the National Labor Relations Act and the Railway Labor Act.

Generally, the number of contract renewal disputes resulting in Board appointments exceeded those for initial contracts: 64 percent were appointed in contract renewal cases, 7 percent were in reopener agreements, and the remaining were in first contracts. Seventy percent of the Boards were appointed for situations involving hospitals; 17.5 percent dealt with nursing homes disputes, and 10.8 percent involved other facilities, such as clinics and health maintenance organizations. In 37 percent of the Board cases, the mediators believed that one or both of the parties had delayed bargaining in anticipation of a factfinding board. More union than management negotiators wanted the Board of Inquiry, while more management than union chief negotiators believed that the other had delayed bargaining in anticipation of a Board of Inquiry.

Although the Service Employees International Union negotiated the largest percent of health care contracts (32.4 percent), it ranked third in its involvement in Boards of Inquiry (15.9 percent). District 1199 was involved in 45.8 percent of the boards, but only 16 percent of the negotiations; the various State nurses associations were parties in 19.2 percent of the Board of Inquiry situations and 15.9 percent of the health care negotiations.

Individuals selected to serve on Boards of Inquiry were chosen on the basis of their competency in factfinding, arbitration, and mediation skills, as well as experience in the health care field. Another primary criteria in the selection process was availability, because the Board must be appointed quickly, and its members must contact the parties, arrange for a meeting, and write recommendations all within 15 days. In all but 10 Boards, a single individual had been appointed, rather than a multiperson panel.

Despite criticism voiced by health care administrators and leaders of major unions that individuals selected to serve on Boards of Inquiry were uninformed about problems of the industry or issues raised at the bargaining table, three-fourths of the chief negotiators queried said that the persons assigned to the Board were qualified and knowledgeable in labor relations. Nevertheless, when further asked as to the preference of having a choice—in conjunction with the other party—on the selection of the factfinder, 70 percent of the management and 57 percent of the labor negotiators favored such an option.

Approximately two-thirds of the management negotiating committees were headed by outside legal counsel, while almost half of the union bargaining teams were headed by either the union business agent or international representative. Mediators noted that, although they encountered a number of inexperienced negotiators when the amendments first became effective, this occurs less frequently now. Many mediators commented on the unusually large bargaining committees in health care, compared with other industries.

The reports. Board of Inquiry reports ranged from a detailed discussion of all outstanding issues to simply "We met, we bargained, we settled." Forty percent of the reports contained no recommendations, due primarily to the initial 6-month period following enactment of the legislation when appointments were based on a strict interpretation of the impact on the delivery of health care without consideration to the state of bargaining. The mediators indicated that when the parties had met and negotiated before the Board convened, it was more likely to issue recommendations on how to resolve the remaining items in dispute.

Both the mediators and the individuals on the Boards felt that in approximately 2 of 5 situations, no effective negotiations had taken place prior to the board appointment. Again, this situation was most evident during the first 4 months after amendments became operative.

In almost three-fourths of the factfinding cases, the mediator was able to use the Board of Inquiry recommendations as the basis for further negotiations. In 14 percent of the situations, no additional mediation sessions were held, and in 13 percent, the parties accepted the factfinder's recommendations in total. Labor and management negotiators shared similar views on the value of the Board of Inquiry procedures; about 60 percent of both groups found the procedures useful. When asked to evaluate the usefulness of the recommendations, a slightly higher percentage of management than labor representatives found them helpful.

Ninety percent of the disputes that were settled prior to the convening of the Board occurred in the first year, and no reports were issued in these cases. Instances of the parties reaching agreement either prior to or during the Board's term were restricted to Boards appointed under the statute, rather than those appointed after a stipulation agreement had been reached.

During the congressional hearings on the amendments, eight factors were identified to be considered by the Board of Inquiry in making recommendations: (1) area wage levels, (2) adequate provisions for job security and fringe benefits, (3) cost of living, (4) career advancement, (5) equal employment opportunity, (6) equal pay, (7) provision for resolution of grievances without strikes, and (8) job training and skills.[2]

Individuals who served on a Board were asked which of these or other factors they considered in issuing recommendations. Most factfinders limited their considerations to economic issues and believed that these were the issues most often raised by the parties themselves. The specific recommendations offered in the reports and the comments of the negotiators, mediators, and factfinders indicated that issues in health care disputes were not very different from those in other sectors. In first-contract bargaining, issues involving union security and dues checkoff were frequently found. Other variances were related more to the relative degree of importance of issues, such as scheduling and patient care, although many of these factors have counterparts in other industries running 24-hour operations.

Recommendations for change. Most (80 percent) of those involved in health care negotiations would like to see changes in the amendments. The dissatisfaction with the current amendments centers on the Board of Inquiry procedures; suggestions for revamping focus on the timing problems experienced by the participants.

Members of factfinding boards were almost unanimous in their displeasure with the 15-day maximum term for the Board. Generally, they felt that the Board should be convened close to the expiration date. Solutions to the timing of a Board most often endorsed by the mediators and chief negotiators included factfinders appointments at the discretion of the mediator at any time and at the request of either party.

Impact on strikes

One of the most important concerns motivating the enactment of the 1974 amendments was the desire to eliminate strikes, particularly those involving recognition. A review of the 2-½ years following the enactment of the legislation indicates that the strike rate in the health care industry is similar to that in the economy as a whole, with a stoppage occurring in about 4 or 5 percent of all bargaining situations. Of 2,585 health care bargaining situations between August 25, 1974 and December 31, 1976, 129 strikes occurred. Another similarity is the duration of strikes, about 27 days both in all bargaining and in health care situations, although there appear to be longer and more bitter strikes in nursing homes. In a number of nursing home strikes, no collective bargaining ever occurs nor is a contract signed, and the union walks away after gaining recognition.

Unlike the practice in other industries, picket lines are infrequently honored by other organized units, making strikes by small units less effective. This "nonsupportive activity" occurred prior to 1974 as well and before the required 10-day strike notice.

Despite the similarities between bargaining in health and other industries, there is an important and distinct difference. In the health care industry, about one-third of all bargaining involves initial contracts, a proportion substantially higher than in other industries. Viewed under this circumstance, it might be concluded that the strike rate is actually better than in the economy as a whole, because few, if any, other industries are undergoing the rapid rate of new bargaining.

Mediators found the 10-day strike notice useful in promoting negotiations, especially in initial contracts. Labor unions, in contrast, found the notice cumbersome and confusing, but most importantly also felt that it provided management time to hire replacements and prepare for a strike. While the number of 10-day strike notices issued is not known, in 65 percent of all Board situations, a strike notice had been given, but a strike occurred in only 13 percent.

Influence of the National Labor Relations Board

Since the 1974 amendments were enacted, the National Labor Relations Board (NLRB) has decided a series of key issues which influenced collective bargaining in the health care industry. Two major decisions were the resolution of unit determination issues and denial of bargaining rights for interns and residents.

In extending bargaining rights to nonprofit hospital workers, Congress cautioned the NLRB to give "due consideration . . . to preventing proliferation of bargaining units in the health care industry."[3] After much deliberation, the NLRB determined that five units would be appropriate in hospital settings: (1) all registered nurses "if they are sought and they so desire" to be represented, (2) all other professionals, (3) technical employees, excluding service and maintenance personnel, (4) clerical employees in business offices, and (5) service and maintenance personnel, including nonoffice clerical workers. A sixth unit was added in 1977 to include physicians, excluding interns and residents.[4]

However, the clearly defined units have not solved election determination problems and have posed a threat to craft type unions which have represented health care workers.[5]

Another group whose survival has been threatened is the American Nurses Association and its State affiliates which act as the bargaining representatives. Current developments, including the challenge of the organization's status as a bargaining representative because of alleged supervisor domination, may result in internal change within the organization, strong takeover challenges by other labor organizations, or the splintering of established nurses' groups into independent unions.

While the NLRB amended its five basic unit determination decisions to include physicians, it explicitly treated interns and residents as students and not as employees covered by the amended National Labor Relations Act. In March 1976, the NLRB reasoned that housestaff physicians were enrolled in a program designed as a prerequisite for licensing examinations and certification in medical specialties not for the purpose of earning a living.[6] The question of whether interns and residents may engage in bargaining has generated considerable litigation and the introduction of bills to amend the 1974 amendments.[7] □

——*FOOTNOTES*——

[1] Because the 1974 amendments extended coverage of the National Labor Relations Act to the private health care industry, organizations of workers in public facilities and the role of the American Federation of State, County and Municipal Employees (AFSCME, AFL–CIO) and other organizations representing health care workers in the public and Federal sector are not discussed in this report.

[2] See *Congressional Record*, July 11, 1979.

[3] *Legislative History of the Coverage of Nonprofit Hospitals Under the National Labor Relations Act, 1974, Public Law 93–360, S. 3203* (U.S. Congress, Subcommittee on Labor, 93d Congress, 2d Sess., 1974, Report No. 93-760), pp. 12 and 274.

[4] A series of NLRB decisions form the basis for the unit determination rulings. See *Mercy Hospital of Sacramento*, 217 NLRB No. 765 (1975); *Barnent Memorial Hospital Center*, 217 NLRB No. 775 (1975); *St. Catherine's Hospital of Dominican Sisters of Kenosha, Wisconsin, Inc.*, 217 NLRB No. 787 (1975); *Sisters of St. Joseph of Peace*, 217 NLRB No. 797 (1975); *Newington Children's Hospital*, 217 NLRB No. 793 (1975); and *Ohio Valley Hospital Assn.*, 230 NLRB No. 84 (1977).

[5] For example, when the NLRB rejected a separate unit for stationery engineers in the 1975 Shriner's Hospital case (*Shriner's Hospital for Cripple Children*, 217 NLRB 806 [1975]), four hospitals in Kansas City filed petitions to decertify the International Union of Operating Engineers, which had represented this occupation for 20 years. While the union was successful in defeating the decertification, it amended its bylaws to expand its jurisdiction in order to continue representing health care workers. Four years later, the NLRB reversed its position and held that a community of interest does exist among the maintenance employees and power plant operators and that a separate unit is appropriate (*Riverside Methodist Hospital of Lynwood*, 78 NLRB No. 1048 [1979]).

[6] *Cedars-Sinai Medical Center*, 223 NLRB No. 251 (1975); reconsideration denied, 224 NLRB No. 626 (1976).

[7] More recently, the U.S. Court of Appeals for the District of Columbia Circuit held that the NLRB's 4-to-1 ruling in the *Cedars Sinai Medical Center* case was incorrect and that the legislative intent had been to extend the benefits of the NLRB to housestaff physicians. *National House Staff Association et al* vs. *Murphy* (C.A.D.C. No. 78–1209, Apr. 2, 1979). Again in 1979, Congress considered amending legislation to permit interns and residents the right to bargain as employees; however, the measure failed to enlist the needed support.

Measuring the social costs of instability in construction

Roger L. Bowlby, Sidney L. Carroll,
and Richard Evans

Governmental interest in stabilization of the U.S. construction industry dates back more than 50 years. The Hoover Commission of 1924 found that "Bad weather is not the principal cause of seasonal idleness. Customs which became fixed when builders had not yet learned to cope with adverse weather conditions have not yet been changed to meet improvements in building materials, the development of new equipment, and innovations in management methods."[1] A more recent study noted that "From its low point in February to its peak in August, contract construction . . . adds enough workers to staff the entire motor vehicle manufacturing industry."[2]

The authors recently participated in a study of the social costs of instability in the construction industry.[3] This report is drawn from that work, which was motivated by a desire to measure the potential benefits from stabilization.

The cost estimate assumed that the technology was available to reduce, but not eliminate fluctuations in construction activity. The nature of this technology or the reasons why it has not already been applied were not considered. Similarly, changes in government policy or other variables that would lead to stabilization were not considered. The cost of instability in 1977 was estimated by assuming that stabilization was accomplished some time before 1977, so that any windfall gains or adjustment costs of a one-time nature had already been realized.

Manufacturing was used as the standard of employment stability. However, the fragmented organization of construction, the custom nature of its output, and its exposure to weather make it unlikely that construction could attain the stability of manufacturing, even with new technology. Therefore, a position half-way between the present instability of construction and the stability

---

Roger L. Bowlby is professor of economics and Sidney L. Carroll is associate professor of economics at the University of Tennessee; Richard Evans is assistant professor of economics at Memphis State University.

attained by manufacturing represented a reasonable goal. The estimates generally assumed that such a position was reached before 1977 and maintained during that year.

As reported in the full study, the potential savings from stabilization construction during 1977 was estimated at $5.7 billion. This total was the result of the estimated potential savings for the following specific areas:

Area of potential savings	*Millions of dollars*
Total	$5,674.1
Lower unemployment benefit costs	562.0
Lower depreciation charges on invested capital	175.8
Lower inventory carrying costs by supplier firms	281.4
Lower wage rates and higher annual incomes	3,877.0
Fewer accidents	570.0
Shorter apprenticeship and fewer dropouts	207.9

Underlying these estimates are the following assumptions. With more intensive utilization of resources, the construction industry could produce the same volume of output with smaller inputs of labor and capital, thus freeing up resources for productive use by other industrial sectors. The value of the additional goods and services produced represents the social costs. Subsidiary gains could be realized if the remaining labor resources experience less disutility per unit of time worked or a higher degree of satisfaction per unit of real income, or if any resources become more productive per unit of effort. The dollar estimates are limited to the proximate effects of stabilization and to accounting categories included in the gross national product.

The turnover effect

The direct savings from lower labor turnover are perhaps the clearest savings, and so the costs of excess labor employed in construction are the most obvious. The industry provided more than 3.4 million full-time jobs in 1970; because of turnover, however, it employed more than 6 million persons during the year.[4] At one extreme the workers represented by this difference may have sought (or waited for) construction employment during the entire year, representing a total loss to society. At the other extreme, it is logically possible that no social cost was incurred by this turnover, if the displaced workers preferred school attendance, leisure, or other forms of nonparticipation to employment during their nonworking periods, or if they found jobs in other industries without frictional loss. The truth probably lies somewhere between these extremes.

Though an imperfect measure, insured unemployment benefits paid out provide the best available measure of the social loss. Though the strength of their attachment to the construction industry is uncertain, workers last employed in construction and drawing unemployment benefits are neither employed in other industries nor out of the labor force. If they are looking for jobs in other industries, their labor is still lost to society, and their separation from the construction industry is the proximate cause of their unemployment.

Table 1 shows insured employment and unemployment in contract construction by month during 1977. For each month, the hypothetical unemployment rate is the mean of the actual rates for manufacturing and construction. Hypothetical unemployment was calculated so as to produce this rate with actual employment unchanged. The reduction in insured unemployment represents labor that could be released from construction and made available to the rest of the economy. With stabilization completed prior to 1977, the absorption of these displaced construction workers by the rest of the economy also had been completed before 1977. Thus, the unemployment rate experienced by the released workers would be equal to the insured unemployment rate for workers outside construction, ranging from a low of 3.2 percent in November to a high of 4.7 percent in February. For each month, the gain to society from construction stabilization is the unemployment decrease in construction minus the unemployment increase in the rest of the economy.

If these weeks of unemployment are converted into dollars at the rate of the average unemployment benefit (which ranged from $75.92 in July to $81.54 in December), approximately $493 million of "avoidable" benefits were drawn by construction workers during 1977. In addition, it was estimated that the administrative costs associated with these transfer payments was $69 million.[5] Thus, the potential cash savings from a reduction in insured unemployment through moderate stabilization in construction during 1977 was estimated at $562 million.

As part of a more speculative analysis of foregone earnings, these unemployment benefits were used as a partial measurement of the total cost of unemployment to society—the waste of unrecoverable productive labor. (This cost was not included in the $5.7 billion of potential savings.) Because unemployment benefits seldom exceed half of lost wages, and typically have been significantly less, workers themselves absorb a significant amount of the social cost. With the social value of the lost labor as twice the unemployment benefits paid, the social cost of the 6,222,000 work weeks lost during 1977 was estimated at $1,035 million. This represents the value of the socially useful goods and services that could have been produced by the labor released by a more stable construction industry, offering the same number of working weeks to a smaller number of individuals with lower turnover rates. This estimate does not include the labor loss not compensated by unemployment benefits, although uninsured joblessness

Table 1. Employment and unemployment in contract construction by month, 1977

Month	1977 Actual		Hypothetical unemployment (after stabilization)	Unemployment rates	
	Insured employment	Insured unemployment		Actual	Hypothetical
January . . .	3,225,000	703,200	437,700	17.9	12.0
February . .	3,152,000	768,300	462,600	19.6	12.8
March	3,270,000	646,200	395,900	16.5	10.8
April	3,451,000	466,200	308,300	11.9	8.2
May	3,608,000	305,200	214,000	7.8	5.6
June	3,675,000	263,900	199,500	6.7	5.2
July	3,655,000	254,100	208,600	6.5	5.4
August	3,693,000	227,400	188,300	5.8	4.8
September .	3,712,000	199,500	162,700	5.1	4.2
October . . .	3,732,000	217,200	171,800	5.5	4.4
November .	3,686,000	252,000	194,000	6.4	5.0
December .	3,499,000	406,100	271,500	10.4	7.2

represents a social loss as certainly as does insured unemployment.

More productive capital

Though capital does not draw unemployment benefits, the same sort of potential social benefits would flow from more intensive utilization of a smaller quantity of physical capital. It was assumed that the capital inputs to the productive process in contract construction could be reduced by 2.5 percent through regularization of activity. This is somewhat less than the 3.1 percent reduction in the labor force implied by the data in table 1. In both cases, it was assumed that resources stand avoidably idle for such reasons as a customary building season, an arbitrary fiscal year, or lack of long-term planning, perhaps the result of a deficiency in information. What is demonstrably true in the case of labor can be presumed true in the case of nonhuman resources.

John W. Kendrick has estimated the capital employed in the construction industry at $39 billion in 1973.[6] Based on the 3.5 percent per year long-run growth trend, the 1977 capital stock was estimated at $45 billion. A 2.5 percent reduction in capital, if carried out entirely in 1977, would have yielded more than $1 billion of savings to the industry, and freed this amount of capital for deployment in other industries. Society could have benefited from higher production without loss of any construction output. However, if stabilization was completed before 1977, then this one-time potential gain can be ignored.

There would still be two potential gains to be counted for 1977: the 3.5 percent increase in capital required for long-term growth would be $43 million dollars less by reason of the lower base (the one-time reduction which took place before 1977); there also would be lower depreciation charges during 1977 on the decreased capital stock. Allowing straight-line depreciation at 6 percent, and assuming that depreciation depends only upon time and will not be accelerated by more intensive use of the smaller stock of capital, there were potential savings of $66 million from this source in 1977.

The effect on suppliers

Vendor firms that supply inputs such as bricks and mortar to the construction industry experience measurably higher costs because of irregular purchases by the construction industry. These become costs to society because the supplier firms, like the construction industry itself, must use extra resources that are denied to society and cannot be used to produce other goods and services. For computational purposes, it was assumed that vendor firms operate at a steady rate throughout the year altering their inventories to suit the erratic demands of the construction industry. In the real world, of course, some of these firms will close, so some of the costs will be embodied in idle labor and capital. Costs of these idle factors of production should approximate the estimated inventory carrying costs.

Carrying inventories involves a real cost to society in losses from fire, theft, casualty, and deterioration as well as from expenditures of land, labor, and capital that are made in order to minimize these losses. The annual costs for a widely fluctuating inventory were estimated at 20 percent of the average inventory value, partly because the land and capital requirements are a function of the maximum inventory.

To establish the base on which to apply this percentage rate, it was assumed that the timing of purchases by the construction industry coincides with the monthly total of value put in place. Thus, the amplitude of seasonal variation in purchases was estimated as the difference between the high and low months. Because the high and low months are about 6 months apart, half of this amplitude represents the mean excess inventory attributable to the instability of the construction industry.

The purchases of the construction industry from supplier firms were estimated by an input-output model, with separate estimates for five construction sectors.[7] Based on these data, the construction industry made $58 billion of direct purchases from supplier firms in order to put $100 billion of value in place. The difference between monthly purchases at the August peak and February trough amounted to $1.8 billion. In an average month during 1977, the vendor firms maintained approximately $900 million of excess inventories over and above the inventory that would have been required to supply a stable industry, and the excess costs to suppliers were $180 million during the year. There are no offsetting gains to others, and so this figure represents the social cost. It must be emphasized that inventory carrying charges were used as a proxy for these social costs, much of which came in layoffs or other manifestations of seasonality not estimated directly. The result, therefore, may overestimate the costs to vendor firms, who may find it cheaper to operate seasonally themselves, and shut down during the slack season in preference to maintaining inventories. In this case, of course, the supplier firms avoid the cost by passing it on to their workers, or to other taxpayers who pay transfer payments to the unemployed workers. The social cost remains.

Reduced wage differential

Economic theory suggests that labor markets are characterized by "equalizing" wage differentials that operate to make jobs equally attractive by offsetting nonwage attributes of less desirable jobs.[8] Construction industry wages are high, therefore, partly to compensate workers for the irregularity of employment. Stabilization of construction industry employment has the potential to benefit both labor and management by increasing the yearly hours of work per worker, making it possible to simultaneously lower wage rates and increase annual income. This would occur automatically in a perfectly competitive market; as the risk of layoff falls, the equalizing differential is reduced and all the benefits of stabilization accrue to employers in the form of lower wage rates. In a market perfectly controlled by workers, the differential might be maintained, so that all benefits accrue to workers as higher annual income. Collective bargaining may produce a compromise result, as the give and take between labor and management leads to a sharing of the benefits of stabilization.

The collective bargaining experience of the Tennessee Valley Authority involves separate union contracts for construction workers, even though most of these workers have the same job titles as some nonconstruction workers. Over 20 years, however, a stable wage differential developed in favor of construction workers, confirming the essential validity of the theory predicting such a result. It was assumed that this wage differential was typical of such differentials in the United States.

The wage differentials were computed for each occupational group on the Tennessee Valley Authority payroll and were weighted by the national importance of each occupation based on census data. If exactly half of the wage differential was eliminated through stabilization,[9] it was estimated that total wage costs could be reduced by approximately 8.4 percent. Translated to the total U.S. construction payroll, the potential savings for 1977 would have been $3,877 million.

Reduced accident rates

Another potential gain from stabilization would occur if productivity increases as a result of the more intensive—more days per year—use of resources. There are a number of reasons to believe that such may be the case. Training on the job through apprenticeship programs should proceed more smoothly with fewer dropouts, representing $207 million in potential savings. In addition, job skills should remain sharper with more regular use, and accident rates ought to decline.

The potential decline of accidents can be estimated from available data on job tenure[10] and accidents occurring for workers in each job tenure group.[11] It is well established that accident frequency is much higher for workers with the shortest length of service in their current job.[12] If stabilization lowers labor turnover, the mixture of employees would move more toward senior employees with relatively low accident rates.

The median construction worker has spent less than half the time on his present job as has the median factory worker. If stabilization changes the seniority distribution of construction workers to a point halfway between the construction and manufacturing distributions, and if the rate of compensable accidents remains constant across seniority classes, the number of compensable accidents in contract construction would be reduced by 8 percent.[13] The cost of workers' compensation in 1977 for the construction industry was estimated at $1.5 billion,[14] so the cost of the extra accidents attributable to short-term seniority in construction amounts to $114 million, counting only the cost of workers' compensation benefits. The real cost to society, of course, is not only the transfer payments to an injured worker, but the loss of labor, damage to machinery or materials, lost time by uncompensated fellow workers and supervisors, and the like. The total cost of an accident has been cited as five times the workers' compensation cost.[15] Thus, the social cost of these avoidable accidents for 1977 totals $570 million.

THE COSTS SUMMARIZED here are illustrative of the order of magnitude of lost national output attributable to instability in construction. The estimated total social costs/potential savings were $5.7 billion for 1977. By the very nature of the issue, much of the cost was difficult to reduce to dollar terms, and there is room for argument about the size of the dollar total. What seems certain, however, is that the social benefits would justify stabilization efforts if they were feasible from an engineering standpoint and involved the expenditure of even hundreds of millions of dollars. ☐

[12] One of the earliest demonstrations of this relationship was in a 1918 study by Lucian Choney and Hugh Hanna, published as report number 234 by the Bureau of Labor Statistics. Other studies reaching the same conclusion include E. L. Humke, "First Month Found Most Dangerous," *Personnel Journal*, Vol. 14, 1936; H. M. Vernon, "Prevention of Accidents," *British Journal of Industrial Medicine*, Vol. 2, No. 1, 1945; A. M. Adestein, "Accident Proneness: A Criticism of the Concept Based on Analysis of Shunter's Accidents," *Journal of the Royal Statistical Society*, Series A, Volume 115, 1952; and R. H. Van Zelst, "Effect of Age and Experience on Accident Rates," *Journal of Applied Psychology*, Vol. 38, 1954.

[13] Computation of this figure is more fully detailed in *Social Costs of Instability in Construction: A Preliminary Report*, Section II-E.

[14] Costs for the United States are estimated at $14 billion by the Social Security Administration, and BLS Bulletin 1830, *Occupational Injuries and Illnesses by Industry*, 1972, places the number of lost workdays in contract construction at 10.67 percent of the total for the United States.

[15] This figure is given and justified by H. W. Heinrich, *Industrial Accident Prevention, A Scientific Approach*, 3d edition (New York, McGraw-Hill, 1950), p. 50. Heinrich states that the cost is probably higher in construction.

Youth in the work world

No country is satisfied that its youth know enough about the work world, and young people frequently concur in this judgement, acknowledging that they make important educational and occupational decisions on impulse or by chance. As significant as the gaps in knowledge are the false and overglamorized images implanted by the media and the erroneous or limited ideas conveyed by peers, parents, and relatives. While no segment of the youth population is free of these distortions, it is generally agreed that young people from low socioeconomic or disadvantaged backgrounds and minority populations have the greatest deficiencies of information and the least opportunity to obtain reliable information through informal sources. To say this does not refute the related finding that these groups also may have the most meager opportunities and the least inclination to seek and use objective, broad, long-range information.

The negative consequences of faulty or incomplete information are repeatedly cited. During the preparatory education-training period, excessive enrollments in certain courses, changes of courses, and dropping out reflect poor or insufficient information. Later on, difficulty in making decisions, unemployment, failure to enter the labor force, geographical immobility, employment below capacity, frequent job changing, loss of income, and other adverse experiences are attributed to inadequate information. Anxiety, fear, indifference, uncertainty, poor performance, irresponsibility, and dissatisfaction before and after entering work are additional dimensions. Berating the attitudinal and informational deficiencies of youth, employers compound the problem by a reluctance to hire or train young workers and a readiness to dismiss them.

Conventions

Meany farewell, bid to Auto Workers, Teamsters mark AFL–CIO convention

EUGENE H. BECKER

George Meany, president of the American Federation of Labor and Congress of Industrial Organizations for 24 years, said goodby to the "house of labor" he helped to found in a keynote address to the 13th biennial convention of the AFL–CIO in Washington, D.C. And true to form he assured all critics that the labor movement is "alive and well" and, adding in a pugnacious note, "ready to do battle with any foe who would destroy it."

But the retiring Meany, also warned the 895 delegates to the convention, November 15–20, to beware of simply defending the status quo, while exhorting them to "constantly look to the future" for fresh leadership and ideas. Perhaps anticipating that Lane Kirkland, his successor, would invite some of the major independent unions back into the fold, Meany said there are "plenty of rooms in the house of labor," enough to house all organizations of workers. Later in the convention this theme was to be more forcefully picked up by Kirkland. (On January 10, Meany died at the age of 85.)

Kirkland elected president

The convention elected a new team of leaders, headed by former secretary-treasurer Kirkland as president and Thomas R. Donahue, former executive assistant to Meany, as secretary-treasurer. The ascendancy of two staff assistants (Kirkland held Donahue's job from 1960 to 1969) to the two top jobs was itself a break with tradition. They were elected, however, with a unanimity which was as much a tradition for the AFL–CIO as it was an expression of one last bow to the wishes of George Meany. Kirkland had long been touted as heir apparent to George Meany and in September when Meany formally announced his retirement, the mantle of leadership passed easily to his protege Kirkland despite some nascent grumbling and a reported bid for the presidential post by Operating Engineers President J. C. Turner. However, Meany made known to Turner his intention to nominate Kirkland at the convention, a fact of political life Turner accepted.[1]

Donahue joined the staff of the AFL–CIO in 1973, after serving as a vice president with the Service Employees International Union. His election as secretary-treasurer was unanimous. Martin J. Ward, president of the Plumbers Union, had earlier expressed an interest in the secretary-treasurer's job, but when Kirkland endorsed Donahue, Ward bowed out.

The only other elections involved members of the AFL–CIO's executive council. Following its usual practice, the council appointed a nominating committee just prior to the opening of the convention to recommend names for four vacancies on the council. The four new executive council members, elected unanimously, along with the 29 others are: Presidents John DeConcini of the Bakery, Confectionary, and Tobacco Workers; Wayne Glenn of the International Paperworkers Union; Robert Goss of the Oil, Chemical and Atomic Workers; and Daniel Maroney of the Amalgamated Transit Union. In the years since the 1977 convention, the council also added two other members, Fred Kroll, president of the Railway Clerks who filled a vacancy created by the death of Hal C. Davis of the Musicians in 1977, and John J. O'Donnell, president of the Air Line Pilots, who filled a vacancy created by the resignation of Joseph Tonelli of the Paperworkers in 1978.

In his acceptance speech, Kirkland suggested that the Federation would welcome those unions presently outside of it. Without mentioning names, he seemed to be referring to two unions in particular—the Teamsters, and the United Auto Workers—whose present membership is about 20 percent that of the AFL–CIO. George Meany's policy on readmission was to consider it if it were requested. Kirkland issued an invitation in these terms: "All sinners belong in church; all citizens owe fealty to their country . . . and all true unions belong in the American Federation of Labor and Congress of Industrial Organizations." Saying that he has too high a regard for the leaders outside the fold to believe that they can "really be governed by petty person-

al or pecuniary considerations, or ancient and tedious grudges," the Federation is thriving despite "the absence of their contribution to the common weal." He reminded them, too, that "their pride and pelf do not equal what they are missing . . . because everything outside the AFL–CIO *is* really Hoboken."

Douglas Fraser, president of the Auto Workers, took exception to Kirkland's remarks, saying, "the unfortunate choice of words was a setback."[2] Teamster President Frank E. Fitzsimmons was more guarded, however, commenting, "The larger question of our reaffiliation is not immediately answerable. I can only say that we do not look upon the . . . question lightly."[3]

Carter joins in salute to Meany

George Meany had been the only president of the AFL–CIO since the merger of the two labor organizations in 1955. His influence in the American social and political arena has been great, spanning three-score years of activism. He has been counted among labor's most effective leaders.

All convention speakers, delegates as well as guests, noted Meany's accomplishments and contributions and bade him farewell. He was extolled in speech and some pageantry, not without sentiment and nostalgia and the assurance that the principles which the AFL–CIO had followed for 24 years would be preserved and advanced under a new leadership. In his acceptance speech, Kirkland summed up this idea with a single phrase, "Full ahead, steady as she goes."

President Jimmy Carter, the Secretaries of Labor, and Health, Education and Welfare, the minority and majority leaders of the House and Senate, and many others paid tribute to Meany's contributions to the betterment of working men and women across the Nation. However, leading all others in this paean was Lane Kirkland when he rose in support of resolution 265 which, among other things, gave Meany, as president emeritus, a salary for life equal to that of the president and honored him for his devotion to the labor movement over the years. (The Federation's constitution specifies 60 percent.)

Kirkland said the "life work of this one valiant man would do honor to a dozen men, if divided among their histories." And again using the vocabulary of the maritime industry in which he served, he went on to say that the salient features of Meany's record "enlighten and point like a lubber's line of a compass to the principles we must not let go of if we are to keep the faith."

Mergers transform AFL–CIO

Significant social and economic changes since the founding convention of the AFL–CIO in 1955 have had an impact on the nature and structure of the Federation. Changes occurring in the workplace, for example, are quite important to organized labor, because as technology moves in, the structure and nature of the work changes. Production-related workers in factories and plants are being replaced by clerical, administrative, and professional and technical employees at all levels of the economy. This means the old-line AFL and CIO craft and industrial unions that provided virtually all of the membership base of the labor movement 24 years ago may be "slow growth" organizations in the future. However, this is only one area of visible change since the merger.

A part of the groundwork for the merged AFL–CIO was laid in 1953 with the negotiation of a no-raiding agreement between the AFL and CIO. Subsequently, this agreement was embodied in the Federation's constitution. Member unions organizing in the same jurisdiction are encouraged to merge, and although merger is not to be dictated, Meany made a point of calling for it at all subsequent conventions. To date, there have been about 50 mergers, the largest and one of the most recent occurring in June between the Retail Clerks and the Meat Cutters to form the United Food and Commercial Workers with a combined membership of about 1.2 million. As a result of these actions, the number of AFL–CIO affiliates dropped from 138 in 1955 to 103 in 1979.

The structure of the AFL–CIO has also changed in the past quarter century. At its birth, the executive council had 27 members in addition to the president and secretary-treasurer, and since then has increased to 33. Furthermore, the number of trade and industrial departments has grown. Three new departments have been added since 1955: Food and Beverage Trade Department; Department for Professional Employees; and the Public Employee Department. Their formation reflects the increased attention organized labor is giving to groups considered "not organizable" in the past and reflects, as well, the changing nature of the work force. Among the targets for organizing drives listed by Meany in 1955 were teachers, white-collar workers, and government employees. Among the last group, membership in AFL–CIO affiliates has increased almost fourfold since 1956, from about 700,000 to almost 2.5 million in 1978.

High on the agenda of the AFL–CIO at its founding was the issue of civil rights. It was then couched in terms of encouraging "all workers without regard to race, creed, color, national origin, or ancestry to share in the full benefits of union organization."[4] In a 1973 constitutional amendment, sex was added to the list. An additional and continuing emphasis is being placed on affirmative action and equal employment opportunity programs "designed to open opportunities in the workplace that were previously closed to minorities and women."[5] Singled out in this respect was a major civil rights resolution, "Equal Pay for Work of Comparable Value." This resolution noted the continuing growth in the differentials between men's and women's wages and the undervaluation of the work that women have historically performed. The resolution urged efforts to correct these inequalities.

Kirkland used the occasion of this resolution to inform the delegates of an allied action taken by the executive council that would explore ways and means by which the "great contribution and role of women and minorities might be better reflected in that highly visible and important" body, that is, the executive council. The council agreed to establish a special committee to determine how women, blacks, and Hispanics might become members of the executive council. What the outcome will be is yet unclear because the council has generally been a white male preserve, limited to the presidents of affiliated unions. However, the only constitutional requirement for membership on the council is election to the AFL–CIO as vice president, and this is open to any member of an affiliated union.[6]

Obstacles to organizing

Organizing the unorganized was of as much concern at the 1979 convention as it was in 1955, though the emphasis was different. At the founding convention the resolution on the subject established the goal of doubling union membership in the years to come as well as revising the Taft-Hartley Act, which has long been looked upon by labor as an important cause of organizing reverses. Neither goal has been met; in those areas the AFL–CIO has suffered numerous setbacks.

The 1979 convention called for a strengthening of existing organizing programs, and the development and expansion of new programs. One resolution decried the increasing effectiveness of anti-union consultants, described by the executive council as "a new growth industry of union-busting 'labor-management consultants'—lawyers, psychologists, and other specialists—who depend for their livelihood on defeating or frustrating workers who seek to form unions and bargain collectively . . . through every legal and often illegal means . . . ." The resolution called on affiliates to report activities of anti-union consultants to the Federation's Department of Organizing and Field Services. It also called for legislation to deny consultants the use of tax exempt public and private colleges as a forum to promote "programs teaching employers how to violate the Nation's labor relations laws, which recognize workers' rights to organize and to bargain collectively."

While the 1955 goal of doubling membership in the AFL–CIO may have been optimistic, the Federation has managed to increase its membership base, but only marginally. The Bureau of Labor Statistics' biennial survey of union membership for 1956 showed a total AFL–CIO membership of 16.8 million. The 1978 survey reported a preliminary figure of about 17 million. However, the 1978 data exclude the Teamsters, expelled from the AFL–CIO in 1957 under the ethical practices provisions of the Federation's constitution, and the Auto Workers which withdrew in 1968. These two unions reported a total membership of 3.4 million in 1978 and 2.7 million in 1956. Adjusting the 1956 AFL–CIO membership figures to exclude the Teamsters and the Auto Workers provides a more realistic idea of organizing gains since 1956.[7]

As a further assist to effective organizing, the delegates pledged anew their founding convention resolve to repeal Section 14(b) of the Taft-Hartly Act, which gives precedence to State laws concerning union security which are more restrictive than those of the Federal Act. Recalling that the Senate in 1978 was not able to muster sufficient votes to cut off a filibuster on the proposed labor law reform bill, which among other things would have repealed the offending Section, Senator Robert C. Byrd, D-W.Va., treated the delegates to a lesson in "the new math:" To invoke cloture, he said, 60 votes are needed, not a simple majority of 51. He then suggested that if organized labor " . . . can't get 60 votes to invoke cloture, you won't be able to pass the legislation." The delegates adopted a resolution on labor law reform calling for legislation "narrow enough to be put to a vote and yet broad enough to be worthy of our support and passage."

Safeguarding collective bargaining laws

Beyond the usual resolution in favor of free collective bargaining and higher wages and fringe benefits, the founding convention had little to offer in the way of prescriptive advice. As has long been a tradition, the Federation assumes no direct responsibilities in this area which is of more direct concern to the individual unions. Nevertheless, the AFL–CIO does attempt to safeguard or improve the framework of laws or administrative actions under which collective bargaining functions.

In this regard the convention voiced its strong opposition to President Carter's program of wage guidelines announced in October 1978 as frustrating collective bargaining. At the same time, the delegates gave guarded approval to the "national accord" recently reached between the Administration and the AFL–CIO.

The accord for the first time established for labor "an acknowledged central role in the development of national and social economic policy."[8] It conditions labor's participation in a voluntary anti-inflation program on a "more equitable low-wage exemption, a system for hearing appeals and broader participation in the development of wage standards . . ."[9]

However, because the AFL–CIO has equal representation on the Pay Advisory Committee (established by the "national accord") which provides public participation and advice to the Council on Wage and Price Stability, it can now influence collective bargaining policy. The Pay Advisory Committee has as its responsibility to recommend changes in the basic 7 percent pay standard, the inflation assumption to use for evaluating automatic wage escalator contract clauses, the treatment of allied collective bargaining relationships, and the proper standard for workers not covered by wage escalator clauses.[10]

The "national accord," nevertheless, is not seen as a first step toward a program of mandatory wage and price controls. A clue regarding the potential difficulties in fully implementing the accord is found in a statement contained in a resolution on the national economy:

> "An overall anti-inflation program must be developed that is comprehensive, effective, and fair. If there is to be sacrifice, it must be shared according to the ability of groups in society to shoulder the sacrifice. If there is a need for a mandatory program of controls with the penalties for non-compliance, it should be a specifically legislated program of across-the-board controls, covering every source of income including profits, dividends, rents, interest rates, executive compensation, professional fees, as well as wages and prices."

Action on the floor

Underlying the harmony at the convention was the fact that all substantive policy decisions had been agreed to by various committees before the delegates voted as a whole. With only a few exceptions, the 309 resolutions were unanimously adopted without debate, or returned to executive council for further consideration.

The Musicians union led by Victor W. Fuentealba, had objected to the across-the-board 3-cent increase in monthly per capita dues and suggested, instead, a 2-tier tax structure to aid certain unions, the Musicians among them. The dues increase, from 16 to 19 cents, was recommended by the executive council just prior to the opening of the convention.[11] Claiming that the Musicians were faced with a unique set of problems—75 percent of their members are either unemployed or work part time at their jobs, that the National Labor Relations Board has ruled that musicians working in hotels, lounges, nightclubs, or catering houses, are not considered employees and thus are prohibited from picketing because of the lack of an employer-employee relationship, and that the union itself is over $1 million in debt—the union asked to be exempted from the across-the-board dues increase. Fuentealba indicated that if the convention did not concur "there soon may be another empty room in that house."

Kirkland took this as a direct threat to disaffiliate and dug for precedent into the Federation's history books to reiterate AFL–CIO policy. Citing a similar threat in 1912, faced by Samuel Gompers, he noted that Gompers' solution was to enjoin the executive council of the AFL from "taking any action whatsoever on the request of the brothers until such threat is withdrawn." A similar threat was made in 1961 and George Meany, citing the 1912 incident, said it was still the policy of the AFL–CIO not to bow to threats. To a round of applause from the delegates, Kirkland said "I again state that that is the continuing policy of the AFL–CIO." When finally the issue came to a voice vote, the convention rejected the Musicians' resolution for a 2-tier tax structure.

Displeased with the direction of many Carter Administration programs dealing with unemployment, inflation, recession, and taxes, the delegates approved a comprehensive resolution on the subject. Stating that the economy is saddled with the "twin evils of recession and continued high inflation," the resolution called for halting the downturn of the economy so that it "may reach its full potential of full employment, production, and real income." It went on to list a number of specific measures needed to meet the problems of recession and inflation, including a Federal stimulus to expand the economy and cut unemployment, tax reform, and the adoption or acceleration of government programs designed to provide jobs for the Nation's unemployed.

Fearing that the Administration proposals to cut back certain social security benefits in 1979 were a "trial balloon for what may be a larger effort" in 1980, the *Report of the Executive Council* said the program must be kept on a sound financial basis and that there is a need to strengthen its basic protections. The *Report* urged Congress to adopt a number of improvements to the program: Adjust benefits biannually instead of once a year; provide an occupational definition of disability for workers age 55 or over because these workers have little chance to obtain employment in an occupation, especially during periods of high unemployment; permit early retirement at age 60 but "with less than the full actuarial reduction in benefits;" and reevaluate benefit problems associated with women. The *Report* also went on record as opposing universal social security coverage for Federal, State, and local workers unless their present pension benefits are not reduced, the identity of those plans is not lost, and there is no diminution in the opportunity of government employees to improve their retirement systems in the future.

Picking up a page from the 1977 convention, the delegates again adopted resolutions to develop alternative energy sources, conserve energy, and protect the environment. But because of the changes in the energy supply situation since 1977 and record profits of many large oil companies, there was an equally strong call for the nationalization of the oil industry and the adoption of a windfall profits tax of 85 percent. The delegates also called for the establishment of a single governmental agency to determine the amount of oil to be imported, to negotiate its price directly with the OPEC cartel, and to allocate it throughout the United States. Alternative energy sources should not be limited to coal and nuclear energy, the delegates urged. They should also include a host of renewable resources such as wind, solar, tidal, and geothermal energy, and various new areas of potential energy including waste matter, oil shale, tar sands, and synthetic fuels. The nonreturnable bottle industry again got convention support. Fearing that any government legislation designed to restrict or prohibit the use of nonreturnable containers could cost as many as 60,000 jobs, the delegates advised a hands off policy in this regard. They also supported the 5-year accelerated Federal grants-in-aid program under the Clean Water Act to state and local governments. This act, designed to eliminate the national backlog of water and sewer projects, in addition to improving the Nation's water quality, would also create many jobs.

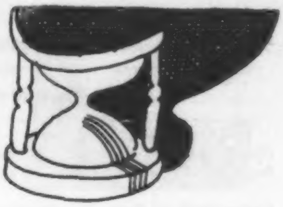
[11] A 3-cent increase was approved at the 1975 convention and again in 1977, both to offset current and expected deficits. The 1979 increase is to offset anticipated deficits of about $4.3 million over the next 2 years.

Major Agreements Expiring Next Month



This list of collective bargaining agreements expiring in March is based on contracts on file in the Bureau's Office of Wages and Industrial Relations. The list includes agreements covering 1,000 workers or more.

Employer and location	Industry	Union[1]	Number of workers
Allied Employers, Inc. (King-Snohomish Counties, Wash.)	Retail trade	Food and Commercial Workers	4,000
American Airlines, Inc., Ground Service (Interstate)[2]	Air transportation	Transport Workers	12,500
Anchor Hocking Corp. (Interstate)	Stone, clay, and glass products	Glass Bottle Blowers	5,000
Associated General Contractors of America, Inc.:			
Connecticut Chapter	Construction	Carpenters	1,100
Maryland Chapter	Construction	Laborers	2,450
San Antonio Chapter (Texas)	Construction	Carpenters	1,300
Borg-Warner Corp., Warner Gear Division (Muncie, Ind.)	Transportation equipment	Auto Workers (Ind.)	1,400
Brockway Glass Co., Inc. (Interstate)	Stone, clay, and glass products	Glass Bottle Blowers	7,500
Builders Association of Missouri, 2 agreements (Kansas and Missouri)	Construction	Laborers; and Teamsters (Ind.)	5,600
Building Managers Association of Chicago (Illinois)	Real estate	Service Employees	5,000
California Metal Trades Association (Northern California)	Fabricated metal products	Machinists	3,000
Campbell Soup Co. (Camden, N.J.)	Food products	Food and Commercial Workers	1,500
Carter County Fibers, Inc., Viscose Plant (Elizabethton, Tenn.)	Chemicals	Textile Workers	1,400
Cincinnati Gas and Electric Co., and Subsidiaries (Ohio)	Utilities	Independent Utilities Union	1,150
Commonwealth Edison Co. (Illinois)	Utilities	Electrical Workers (IBEW)	5,300
Connecticut Construction Industries Association, Inc.:			
Heavy and Highway work (Connecticut)	Construction	Carpenters	6,100
Heavy and Highway work (Connecticut)	Construction	Bricklayers	2,500
5 Divisions (Connecticut, New York, and Rhode Island)	Construction	Operating Engineers	2,500
Dairy Employers Labor Council (Washington)	Food products	Teamsters (Ind.)	1,000
Food Markets Agreement (Minneapolis, Minn.)[3]	Retail trade	Food and Commercial Workers	6,500
Glass Containers Corp. (Interstate)	Stone, clay and glass products	Glass Bottle Blowers	3,100
Gould, Inc. (Philadelphia, Pa.)	Electrical products	Auto Workers (Ind.)	2,800
Grower-Shipper Vegetable Association, Packinghouse Agreement (California)	Wholesale trade	Food and Commercial Workers	1,000
H. J. Heinz Co., Heinz U.S.A. (Pittsburgh, Pa.)	Food products	Food and Commercial Workers	1,800
Heavy Construction Association of Greater Kansas City Area (Kansas and Missouri)	Construction	Laborers	1,500
Imperial and 3 others Negotiating Committee (California and Arizona)	Agricultural services	Food and Commercial Workers	2,000
Indian Head, Inc. (Interstate)	Stone, clay and glass products	Glass Bottle Blowers	2,300
Industrial Conference Board, grocery stores (Pierce County, Wash.)	Retail trade	Food and Commercial Workers	1,600
ITT Continental Baking Co. (Crozet, Va.)	Food products	Teamsters (Ind.)	1,000
Liggett Group, Inc. (Durham, N.C.)	Tobacco	Bakery, Confectionery and Tobacco Workers	1,650
Metal Trades Independent Companies (California)[3]	Fabricated metal products	Machinists	2,450
Michigan Distribution Contractors Association (Michigan)	Construction	Laborers	2,000
Milwaukee Transport Services, Inc. (Milwaukee, Wis.)	Transit	Transit Union	1,200
Moore Co., Inc. (Chicopee and Springfield, Mass.)	Primary metals	Directly Affiliated Unions	1,350
Moving and Storage Industry (New York, New Jersey and Connecticut)[3]	Trucking	Teamsters (Ind.)	2,300
National Broadcasting Co., Inc. (Interstate)	Communication	Broadcast Employees and Technicians	1,550
National Can Co., Foster-Forbes Glass Co. Division (Interstate)	Stone, clay and glass products	Glass Bottle Blowers	2,000
Northern California Dairy Association (California)	Food products	Teamsters (Ind.)	1,600
Owens-Illinois, Inc.:			
(California and Oregon)	Stone, clay and glass products	Glass Bottle Blowers	2,400
Forming Department (Interstate)	Stone, clay and glass products	Glass Bottle Blowers	1,800
Production and Maintenance (Interstate)	Stone, clay and glass products	Glass Bottle Blowers	13,600

See footnotes at end of table.

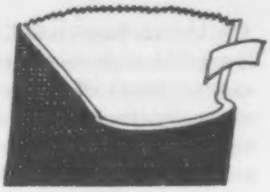
Book Reviews



Now we know how—but can we?

The World Economy: History and Prospect. By W. W. Rostow. Austin, University of Texas Press, 1978. 833 pp. $34.50.

Getting From Here to There: America's Future in the World Economy. By W. W. Rostow. New York, McGraw-Hill Book Co., 1978. 271 pp. $14.95.

These two books are complementary. In *The World Economy,* Professor Rostow starts back in the 18th century and carries the history down to 1977. In the second book, he projects the economic outlook through the next quarter century to the year 2000.

The first book, a comprehensive history of more than 800 pages, traces the various aspects of population dynamics and economic growth over the last two centuries. World population grew at a rate of about 0.5 percent a year up to the year 1900; doubled to 1.0 percent during 1930–50; and then doubled again to 2.0 percent, 1960–70. These developments are analyzed by Rostow, showing that it has been the spectacular decline in death rates throughout the world which has brought about the population explosion.

The author analyzes industrial growth and its diffusion throughout the world, with emphasis on the growth of international trade and makes a more detailed analysis of the stages of economic growth in each of 20 countries, starting with Great Britain and the United States and ending with Taiwan, Thailand, and South Korea.

Professor Rostow devotes a chapter to balanced and unbalanced growth over the last two centuries, followed by a chapter on business cycles, starting with the 18th century, 1700–1783; and followed by the Classic era, 1783–1914; and then by recent developments down to 1973. He closes the historical book with a section on the Future of the World Economy, focusing on the "Fifth Kondratieff Upswing" which is projected for the last quarter of the 20th century. (Kondratieff was a famous Russian historian executed in the mid-1930's by Stalin, who had no use for scholars.)

So the second book (subtitle: *America's Future in the World Economy)* opens with a restatement of the long-range business cycles originated by Kondratieff and carried forward by Rostow. Here are the original cycles with Rostow's continuations:

Kondratieff		*Rostow*	
1790–1815	up	1920–1933	down
1815–1848	down	1933–1951	up
1848–1872	up	1951–1972	down
1872–1896	down	1972–1977	up
1896–1920	up	1977–2000	up?
1920–1930	down		

Kondratieff's idea was that long-range economic cycles covered about half a century, up and then down. But Rostow pointed out that World War II changed the down cycle into a worldwide upturn, which then gave way to a typical postwar downturn, 1952–1972. Following the severe recession, 1974–75, there has been an upturn, which was still underway in 1979. Rostow's thesis is that this could be the beginning of a quarter-century worldwide upturn. He then proceeds to make the case for such a prospect.

In passing, Rostow devotes a chapter to the "Bankruptcy of Neo-Keynesian Economics". Keynes originally had a classical economist's view of business upturns and downturns. But after World War I, the unionized workers in Great Britain forced a general strike in 1926, which prevented normal wage reductions. Keynes then developed the theory that rising consumer incomes would create effective demand for goods and services, which, in turn, prevented a worldwide depression after World War II. However, Keynes had no formula for restraining the economy during inflation.

As Rostow states, "It will no longer suffice to focus obsessively on the indiscriminate expansion of effective demand . . . the world of the 1970's and 1980's cannot afford to waste manpower . . . every man and woman available in the working forces of the advanced industrial economies (must) be put to work on high-priority tasks . . . an extravagant, neo-Keynesian policy makes neither economic nor political sense."

The greatest crisis facing the next quarter century is the population explosion versus limited food production. The world population in 1977 was about 4.0 billion; by the year 2000 it will be 6.5 billion. On the contrary, world food production is failing to keep pace.

The United States and Canada are the only countries in the world with substantial food exports to the hungry nations. Great efforts are being made, locally and internationally, to stimulate higher productivity in agriculture. Futhermore, there is need for an ever-normal granary (such as the United States developed in the 1930's) in order to avoid the wild price fluctuations of the 1970's. Improved agriculture can help the food problem, but it must be supplemented by better population control in many nations.

Rostow then tackles the energy problem, which he labels "A Test of the Democratic Process." When oil prices exploded in 1973–1974, the world economy was shaken into a depression. But the actions of the oil-importing governments failed to match the problem. The United States was the worst performer, upping its imports from 4 million to 8 million barrels per day by 1977. Furthermore, in the United States, the Administration's national energy plan projects such low prices for natural gas that there is little prospect for gas as a solution to the energy problem.

However, Rostow cites technological advances which hold great promise for the longer future—the liquid-metal, fast-breeder reactor, the possibility of fusion, and the eventual solution of solar energy.

He closes on a hopeful note: "The human race faces in the generation ahead, therefore, the greatest challenge it has confronted since modern industrialization began in the late 18th century: the challenge of creating a new, hopefully infinite and non-polluting source of energy."

Raw materials are a major factor in the Kondratieff cycles. In the down phase they become plentiful and cheap. In 1972, for example, the price index for raw materials was only 122; but by 1976 it was 214, not far from double. The shortage was brought about by a slackening of investment in the 1960's combined with the new governmental regulations dealing with the environment, health, and safety.

The domestic U.S. situation was further complicated by international developments. That well-advertised study on *Limits to Growth* had forecast a world-wide long-run shortage of many basic raw materials—copper, lead, zinc, molybdenum, and gold. But a table published by the U.S. Geological Survey in 1973 showed that, at present rates of annual consumption, metals such as coal, iron, uranium, and especially aluminium are in ample supply for thousands of years.

The real problem is distribution. Minerals are often highly concentrated in a few countries (such as lead in Peru) which then may be able to exact a monopoly price. One possible solution is a broad international agreement for fair sharing. Another solution is the discovery of unlimited metals on the ocean floors, on which the United Nations has been unable to get an agreement in 5 years. Rostow's conclusion is that the current raw materials shortage is temporary; there is an ample supply for the longer future.

Productivity in the United States took a turn for the worse during the 1970's. For decades the domestic economy had an increase in output per hour averaging 3 percent a year, which has operated to lower labor costs to that extent. But in the 1970's, the rate fell to 1 percent and in some quarter-years to zero. A dramatic example is coal mining, which had annual increases of about 6 percent a year from 1948 to 1968, but which declined by nearly 3 percent a year in the 1970's.

Two factors are primarily responsible: first, the new health and safety standards, which raised labor costs in many industries, and second, the expansion of jobs in retail trade and the service industries, where productivity is low. With collective bargaining still proceeding on the assumption of substantial productivity increases, the result is a rising cost-of-living inflation.

Rostow has two suggestions. First, workers should recognize that there is (temporarily) no productivity increase for wages, and second, that major efforts should be made to stimulate productivity throughout the economy. The unions should recognize that this is the only solution to inflation; otherwise, rising consumer prices undermine the wage increases before the year is over.

This productivity experience leads Rostow to raise the question, Is Human Creativity on the Wane? His conclusion is that the long-run future is heavily dependent on the success of the next quarter century.

The fact is that U.S. investment in research and development has been declining, whereas in Germany, Japan, and the U.S.S.R., there are significant increases. Yet, there are many new possibilites in developmental biology, astronomy, and materials substitution, plus inventive new directions in agriculture, energy, sea-bed mining, and the communications revolution. Such expansion can only be achieved by private industry. The question is whether the government will give industry the opportunity.

The crucial issue is inflation. In Rostow's words, "How to conduct anti-inflationary policy in the context of the fifth Kondratieff upswing?" There are two answers. One is on the supply side, which is to insure that there is expanding investment in productivity, energy, food, raw materials, and research. The other is on the demand side, where noninflationary wage-price agreements require that both labor and business accept restraints which clash with their conventional ways of operating.

Rostow's solution is long-term voluntary agreements, backed by legal reserve powers. There are three reasons why this may work. First, in public opinion polls, inflation ranks higher than unemployment as the issue of public concern. Second, serious businessmen and labor leaders know that inflation is costly to their respective interests. Third, the circumstances "require that we generate in American society the most important single ingredient for successful wage-price policies: a sense of common purpose."

In his final chapter, "Can Democracy Survive?", Rostow sums up his conclusions in these terms: "In short, if we are forehanded, generate a lucid and generally accepted view of the Nation's problems, and a spirit of public-private collaboration in dealing with them, there is no reason to fear that the policies required to transit with reasonable success the next quarter century would seriously compromise democratic practice and institutions as we have known them. But a failure to meet these conditions could endanger democratic life in the U.S. and throughout the Western world."

In this reviewer's opinion, Professor Rostow's analysis of *Getting From Here to There* should be read by all serious professional forecasters. Inflation in 1979 is already double the 6-percent rate on which Rostow's analysis was based. Furthermore, the new oil price increases, derived from the political collapse of Iran, threaten more inflation. The United States must act immediately to (a) cut its imports of oil from the Middle East (b) economize in the use of gas and oil, and (c) develop new sources of energy in the United States and the North American continent. The time is short and the crisis may come soon. Rostow shows the way—can the United States make it?

of Labor Statistics

Where the working is easy

Comparative Metropolitan Employment Complexes—New York, Chicago, Los Angeles, Houston, Atlanta. By Dale L. Hiestand and Dean W. Morse. Montclair, N.J., Allanheld, Osmun and Co. Publishers, Inc., 1979. 141 pp. $21.50.

Most studies of urban labor markets emphasize the features that such markets have in common. In this exploratory study, Dale L. Hiestand and Dean W. Morse make a significant contribution to labor economics literature by analyzing the effects on five large metropolitan labor markets of the differences among the areas in factors such as size, rate of employment growth, industrial and occupational composition of employment, extent of unionization, political climate, and work attitudes. The five metropolitan areas that the authors analyze—New York, Chicago, Los Angeles, Houston, and Atlanta—contain nearly 16 percent of the U.S. labor force.

Hiestand and Morse focus not only on the effects of interarea differences on traditional labor market processes such as recruitment and hiring, but also on the effects of these differences on workers' mobility within the "internal labor market"—that is, within a firm or other structured organization. Because of the vast number of factors that affect the labor market in each metropolitan area, the authors are unable to base their analysis on statistical correlation techniques. Instead, they present tentative cause-and-effect conclusions based on their own judgments.

Hiestand and Morse present many interesting and useful findings and conclusions. For example:

- Because of its rapid growth, Houston had 10 percent of its labor force employed in construction in 1970—a much higher proportion than in any of the other four areas.
- For several reasons, including the high educational standards in the white-collar industries in which New York specializes, young men enter the labor force there at a distinctly later age than in any of the other areas.
- A worker's initial job determines his career prospects to a greater extent in the slow-growing New York area than in any of the other areas.

The book has two minor faults. First, some of the analysis is superficial. For example, on page 99, the authors observe, "The number of women employed as operatives failed to increase past age 29 in the New York area, reflecting perhaps the decline of manufacturing in the city." It seems to me that the presence of a declining manufacturing sector that could not provide jobs for new labor force entrants would be just as consistent with an aging work force as it is with a work force that is growing younger. Furthermore, the increase only in *young* female operatives in New York probably has as much to do with the age composition of the ethnic groups that supply these operatives as it does with any factor on the demand side of the labor market.

The authors' discussion of the contrasting work attitudes in the five metropolitan areas contains several superficial statements, such as "In Houston, a clever person can make a good living without working overly hard and still enjoy the city's night life and weekends," and "The exodus to the shore or country on Fridays, holiday eves, and during much of the summer are (sic) observable facts of life in the New York area."

My second complaint is that some of the theoretical material in the opening chapters of the book is tedious, and adds little to the reader's understanding of the analysis. Indeed, a savvy Houstonian or a New York manpower "maven" might even skip the first two chapters and get a head start on his night life or weekend.

These two faults detract only minimally from the quality and usefulness of the book. In fact, I raise these two criticisms only because I am employed in Washington, an area that specializes in discovering the faults of the rest of the country.

35. Wage and benefit settlements in major collective bargaining units 110
36. Effective wage rate adjustments going into effect in major collective bargaining units 111
37. Work stoppages, 1946 to date 111

NOTES ON CURRENT LABOR STATISTICS

This section of the *Review* presents the principal statistical series collected and calculated by the Bureau of Labor Statistics. A brief introduction to each group of tables provides definitions, notes on the data, sources, and other material usually found in footnotes.

Readers who need additional information are invited to consult the BLS regional offices listed on the inside front cover of this issue of the *Review*. Some general notes applicable to several series are given below.

Seasonal adjustment. Certain monthly and quarterly data are adjusted to eliminate the effect of such factors as climatic conditions, industry production schedules, opening and closing of schools, holiday buying periods, and vacation practices, which might otherwise mask short-term movements of the statistical series. Tables containing these data are identified as "seasonally adjusted." Seasonal effects are estimated on the basis of past experience. When new seasonal factors are computed each year, revisions may affect seasonally adjusted data for several preceding years. For a technical discussion of the method used to make seasonal adjustments, see "Appendix A. The BLS Seasonal Factor Method," *BLS Handbook of Methods for Surveys and Studies*, Bulletin 1910 (Bureau of Labor Statistics, 1976), pp. 272–78, and *X-11 Variant of the Census Method II Seasonal Adjustment Program*, Technical Paper No. 15 (Bureau of the Census, 1967). Seasonally adjusted labor force data in tables 2–7 were last revised in the February 1980 issue of the *Review* to reflect the preceding year's experience. Beginning in January 1980, the BLS introduced two major modifications in the seasonal adjustment methodology for labor force data. First, the data are being seasonally adjusted with a new procedure called X-11/ARIMA, which was developed at Statistics Canada as an extension of the standard X-11 method. A detailed description of the procedure appears in *The X-11 ARIMA Seasonal Adjustment Method* by Estela Bee Dagum (Statistics Canada Catalogue No. 12-564E, September 1979).

The second change is that seasonal factors are now being calculated for use during the first 6 months of the year, rather than for the entire year, and then are calculated at mid-year for the July-December period. Revisions of historical data continue to be made only at the end of each calendar year. Annual revision of the seasonally adjusted payroll data in tables 11, 13, 16, and 18 was last introduced in the November 1979 issue of the *Review*. New seasonal factors for productivity data in tables 33 and 34 are usually introduced in the September issue. Seasonally adjusted indexes and percent changes from month to month and from quarter to quarter are published for numerous Consumer and Producer Price Index series. However, seasonally adjusted indexes are not published for the U.S. average All Items CPI. Only seasonally adjusted percent changes are available for this series.

Adjustments for price changes. Some data are adjusted to eliminate the effect of changes in price. These adjustments are made by dividing current dollar values by the Consumer Price Index or the appropriate component of the index, then multiplying by 100. For example, given a current hourly wage rate of $3 and a current price index number of 150, where 1967 = 100, the hourly rate expressed in 1967 dollars is $2 ($3/150 × 100 = $2). The resulting values are described as "real," "constant," or "1967" dollars.

Availability of information. Data that supplement the tables in this section are published by the Bureau of Labor Statistics in a variety of sources. Press releases provide the latest statistical information published by the Bureau; the major recurring releases are published according to the schedule given below. The *Handbook of Labor Statistics 1978*, Bulletin 2000, provides more detailed data and greater historical coverage for most of the statistical series presented in the *Monthly Labor Review*. More information from the household and establishment surveys is provided in *Employment and Earnings*, a monthly publication of the Bureau, and in two comprehensive data books issued annually—*Employment and Earnings, United States* and *Employment and Earnings, States and Areas*. More detailed information on wages and other aspects of collective bargaining appears in the monthly periodical, *Current Wage Developments*. More detailed price information is published each month in the periodicals, the *CPI Detailed Report* and *Producer Prices and Price Indexes*. Selected key statistical series are presented graphically in the monthly *Chartbook on Prices, Wages, and Productivity*.

Symbols

p = preliminary. To improve the timeliness of some series, preliminary figures are issued based on representative but incomplete returns.
r = revised. Generally this revision reflects the availability of later data but may also reflect other adjustments.
n.e.c. = not elsewhere classified.

Schedule of release dates for major BLS statistical series

Title and frequency (monthly except where indicated)	Release date	Period covered	Release date	Period covered	MLR table number
The Employment situation	February 1	January	March 7	February	1 - 11
Producer Price Indexes	February 15	January	March 7	February	26 - 30
Consumer Price Index	February 22	January	March 25	February	22 - 25
Real earnings	February 22	January	March 25	February	14 - 20
Productivity and costs:					
Nonfinancial corporations	February 27	4th quarter	. . .	. . .	31 - 34
Work stoppages	February 28	January	March 28	February	37
Labor turnover in manufacturing	February 29	January	March 31	February	12 - 13

EMPLOYMENT DATA FROM THE HOUSEHOLD SURVEY

EMPLOYMENT DATA in this section are obtained from the Current Population Survey, a program of personal interviews conducted monthly by the Bureau of the Census for the Bureau of Labor Statistics. The sample consists of about 56,000 households, selected to represent the U.S. population 16 years of age and older. Households are interviewed on a rotating basis, so that three-fourths of the sample is the same for any 2 consecutive months.

Definitions

Employed persons are (1) those who worked for pay any time during the week which includes the 12th day of the month or who worked unpaid for 15 hours or more in a family-operated enterprise and (2) those who were temporarily absent from their regular jobs because of illness, vacation, industrial dispute, or similar reasons. A person working at more than one job is counted only in the job at which he or she worked the greatest number of hours.

Unemployed persons are those who did not work during the survey week, but were available for work except for temporary illness and had looked for jobs within the preceding 4 weeks. Persons who did not look for work because they were on layoff or waiting to start new jobs within the next 30 days are also counted among the unemployed. The **unemployment rate** represents the number unemployed as a percent of the civilian labor force.

The **civilian labor force** consists of all employed or unemployed persons in the civilian noninstitutional population; the **total labor force** includes military personnel. Persons **not in the labor force** are those not classified as employed or unemployed; this group includes persons retired, those engaged in their own housework, those not working while attending school, those unable to work because of longterm illness, those discouraged from seeking work because of personal or job market factors, and those who are voluntarily idle. The **noninstitutional population** comprises all persons 16 years of age and older who are not inmates of penal or mental institutions, sanitariums, or homes for the aged, infirm, or needy.

Full-time workers are those employed at least 35 hours a week; **part-time workers** are those who work fewer hours. Workers on part-time schedules for economic reasons (such as slack work, terminating or starting a job during the week, material shortages, or inability to find full-time work) are among those counted as being on full-time status, under the assumption that they would be working full time if conditions permitted. The survey classifies unemployed persons in full-time or part-time status by their reported preferences for full-time or part-time work.

Notes on the data

From time to time, and especially after a decennial census, adjustments are made in the Current Population Survey figures to correct for estimating errors during the preceding years. These adjustments affect the comparability of historical data presented in table 1. A description of these adjustments and their effect on the various data series appear in the Explanatory Notes of *Employment and Earnings*.

Data in tables 2–7 are seasonally adjusted, based on the seasonal experience through December 1979.

1. Employment status of the noninstitutional population, 16 years and over, selected years, 1950–79

[Numbers in thousands]

Year	Total noninstitutional population	Total labor force		Civilian labor force						Not in labor force

EMPLOYMENT, HOURS, AND EARNINGS DATA FROM ESTABLISHMENT SURVEYS

EMPLOYMENT, HOURS, AND EARNINGS DATA in this section are compiled from payroll records reported monthly on a voluntary basis to the Bureau of Labor Statistics and its cooperating State agencies by 162,000 establishments representing all industries except agriculture. In most industries, the sampling probabilities are based on the size of the establishment; most large establishments are therefore in the sample. (An establishment is not necessarily a firm; it may be a branch plant, for example, or warehouse.) Self-employed persons and others not on a regular civilian payroll are outside the scope of the survey because they are excluded from establishment records. This largely accounts for the difference in employment figures between the household and establishment surveys.

LABOR TURNOVER DATA in this section are compiled from personnel records reported monthly on a voluntary basis to the Bureau of Labor Statistics and its cooperating State agencies. A sample of 40,000 establishments represents all industries in the manufacturing and mining sectors of the economy.

Definitions

Employed persons are all persons who received pay (including holiday and sick pay) for any part of the payroll period including the 12th of the month. Persons holding more than one job (about 5 percent of all persons in the labor force) are counted in each establishment which reports them.

Production workers in manufacturing include blue-collar worker supervisors and all nonsupervisory workers closely associated with production operations. Those workers mentioned in tables 14–20 include production workers in manufacturing and mining; construction workers in construction; and nonsupervisory workers in transportation and public utilities, in wholesale and retail trade, in finance, insurance, and real estate, and in service industries. These groups account for about four-fifths of the total employment on private nonagricultural payrolls.

Earnings are the payments production or nonsupervisory workers receive during the survey period, including premium pay for overtime or late-shift work but excluding irregular bonuses and other special payments. **Real earnings** are earnings adjusted to eliminate the effects of price change. The **Hourly Earnings Index** is calculated from average hourly earnings data adjusted to exclude the effects of two types of changes that are unrelated to underlying wage-rate developments: fluctuations in overtime premiums in manufacturing (the only sector for which overtime data are available) and the effects of changes and seasonal factors in the proportion of workers in high-wage and low-wage industries. **Spendable earnings** are earnings from which estimated social security and Federal income taxes have been deducted. The Bureau of Labor Statistics computes spendable earnings from gross weekly earnings for only two illustrative cases: (1) a worker with no dependents and (2) a married worker with three dependents.

Hours represent the average weekly hours of production or nonsupervisory workers for which pay was received and are different from standard or scheduled hours. **Overtime hours** represent the portion of gross average weekly hours which were in excess of regular hours and for which overtime premiums were paid.

Labor turnover is the movement of all wage and salary workers from one employment status to another. **Accession rates** indicate the average number of persons added to a payroll in a given period per 100 employees; **separation rates** indicate the average number dropped from a payroll per 100 employees. Although month-to-month changes in employment can be calculated from the labor turnover data, the results are not comparable with employment data from the employment and payroll survey. The labor turnover survey measures changes during the calendar month while the employment and payroll survey measures changes from midmonth to midmonth.

Notes on the data

Establishment data collected by the Bureau of Labor Statistics are periodically adjusted to comprehensive counts of employment (called "benchmarks"). The latest complete adjustment was made with the release of September 1979 data, published in the November 1979 issue of the *Review*. Consequently, data published in the *Review* prior to that issue are not necessarily comparable to current data. Complete comparable historical unadjusted and seasonally adjusted data are published in a Supplement to Employment and Earnings (unadjusted data from April 1977 through June 1979 and seasonally adjusted data from January 1974 through June 1979) and in *Employment and Earnings, United States, 1909–78*, BLS Bulletin 1312–11 (for prior periods).

Data on recalls were shown for the first time in tables 12 and 13 in the January 1978 issue of the *Review*. For a detailed discussion of the recalls series, along with historical data, see "New Series on Recalls from the Labor Turnover Survey," *Employment and Earnings*, December 1977, pp. 10–19.

A comprehensive discussion of the differences between household and establishment data on employment appears in Gloria P. Green, "Comparing employment estimates from household and payroll surveys," *Monthly Labor Review*, December 1969, pp. 9–20. See also *BLS Handbook of Methods for Surveys and Studies*, Bulletin 1910 (Bureau of Labor Statistics, 1976).

The formulas used to construct the spendable average weekly earnings series reflect the latest provisions of the Federal income tax and social security tax laws. For the spendable average weekly earnings formulas for the years 1977–79, see *Employment and Earnings*, September 1979, pp. 6–8. Beginning with data for January 1978, real earnings data are adjusted using the revised Consumer Price Index for Urban Wage Earners and Clerical Workers. Data prior to January 1978 are based on the unrevised Consumer Price Index for Urban Wage Earners and Clerical Workers.

8. Employment by industry, 1949–78

NOTE: The earnings expressed in 1967 dollars have been adjusted for changes in price level as measured by the Bureau's Consumer Price Index for Urban Wage Earners and Clerical Workers (revised). These series are described in "The Spendable Earnings Series: A Technical Note on its Calculation", **Employment and Earnings and Monthly Report on the Labor Force,** February 1969, pp. 6 - 13, See also "Spendable Earnings Formulas, 1977 - 79" **Employment and Earnings,** September 1979, pp. 6 - 8.

UNEMPLOYMENT INSURANCE DATA

UNEMPLOYMENT INSURANCE DATA are compiled monthly by the Employment and Training Administration of the U.S. Department of Labor from records of State and Federal unemployment insurance claims filed and benefits paid. Railroad unemployment insurance data are prepared by the U.S. Railroad Retirement Board.

Definitions

Data for **all programs** represent an unduplicated count of insured unemployment under the State, Ex-Servicemen, and UCFE programs, and the Railroad Insurance Act.

Under both State and Federal unemployment insurance programs for civilian employees, insured workers must report the completion of at least 1 week of unemployment before they are defined as unemployed. Persons not covered by unemployment insurance (about one-third of the labor force) and those who have exhausted or not yet earned benefit rights are excluded from the scope of the survey. **Initial claims** are notices filed by persons in unemployment insurance programs to indicate they are out of work and wish to begin receiving compensation. A claimant who continued to be unemployed a full week is then counted in the insured unemployment figure. The **rate of insured unemployment** expresses the number of insured unemployed as a percent of the average insured employment in a 12-month period.

An **application** for benefits is filed by a railroad worker at the beginning of his first period of unemployment in a benefit year; no application is required for subsequent periods in the same year. **Number of payments** are payments made in 14-day registration periods. The **average amount of benefit payment** is an average for all compensable periods, not adjusted for recovery of overpayments or settlement of underpayments. However, **total benefits paid** have been adjusted.

21. Unemployment insurance and employment service operations

[All items except average benefits amounts are in thousands]

[1] Initial claims and State insured unemployment include data under the program for Puerto Rican sugarcane workers.

[2] Includes interstate claims for the Virgin Islands. Excludes transition claims under State programs.

[3] Excludes data on claims and payments made jointly with other programs.

[4] Includes the Virgin Islands. Excludes data on claims and payments made jointly with State programs.

[5] Cumulative total for fiscal year (October 1 – September 30).

NOTE: Data for Puerto Rico included. Dashes indicate data not available.

PRICE DATA

PRICE DATA are gathered by the Bureau of Labor Statistics from retail and primary markets in the United States. Price indexes are given in relation to a base period (1967 = 100, unless otherwise noted).

Definitions

The **Consumer Price Index** is a monthly statistical measure of the average change in prices in a fixed market basket of goods and services. Effective with the January 1978 index, the Bureau of Labor Statistics began publishing CPI's for two groups of the population. One index, a new CPI for All Urban Consumers, covers 80 percent of the total noninstitutional population; and the other index, a revised CPI for Urban Wage Earners and Clerical Workers, covers about half the new index population. The All Urban Consumers index includes, in addition to wage earners and clerical workers, professional, managerial, and technical workers, the self-employed, short-term workers, the unemployed, retirees, and others not in the labor force.

The CPI is based on prices of food, clothing, shelter, fuel, drugs, transportation fares, doctor's and dentist's fees, and other goods and services that people buy for day-to-day living. The quantity and quality of these items is kept essentially unchanged between major revisions so that only price changes will be measured. Prices are collected from over 18,000 tenants, 24,000 retail establishments, and 18,000 housing units for property taxes in 85 urban areas across the country. All taxes directly associated with the purchase and use of items are included in the index. Because the CPI's are based on the expenditures of two population groups in 1972–73, they may not accurately reflect the experience of individual families and single persons with different buying habits.

Though the CPI is often called the "Cost-of-Living Index," it measures only price change, which is just one of several important factors affecting living costs. Area indexes do not measure differences in the level of prices among cities. They only measure the average change in prices for each area since the base period.

Producer Price Indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. The sample used for calculating these indexes contains about 2,800 commodities and about 10,000 quotations per month selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer Price Indexes can be organized by stage of processing or by commodity. The stage of processing structure organizes products by degree of fabrication (that is, finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

To the extent possible, prices used in calculating Producer Price Indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Most prices are obtained directly from producing companies on a voluntary and confidential basis. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating Producer Price Indexes, price changes for the various commodities are averaged together with implicit quantity weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage of processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings.

Price indexes for the output of selected SIC industries measure average price changes in commodities produced by particular industries, as defined in the *Standard Industrial Classification Manual 1972* (Washington, U.S. Office of Management and Budget, 1972). These indexes are derived from several price series, combined to match the economic activity of the specified industry and weighted by the value of shipments in the industry. They use data from comprehensive industrial censuses conducted by the U.S. Bureau of the Census and the U.S. Department of Agriculture.

Notes on the data

Beginning with the May 1978 issue of the *Review*, regional CPI's cross classified by population size, were introduced. These indexes will enable users in local areas for which an index is not published to get a better approximation of the CPI for their area by using the appropriate population size class measure for their region. The cross-classified indexes will be published bimonthly. (See table 24.)

For further details about the new and the revised indexes and a comparison of various aspects of these indexes with the old unrevised CPI, see *Facts About the Revised Consumer Price Index*, a pamphlet in the Consumer Price Index Revision 1978 series. See also *The Consumer Price Index: Concepts and Content Over the Years*. Report 517, revised edition (Bureau of Labor Statistics, May 1978).

For interarea comparisons of living costs at three hypothetical standards of living, see the family budget data published in the *Handbook of Labor Statistics, 1977*, Bulletin 1966 (Bureau of Labor Statistics, 1977), tables 122–133. Additional data and analysis on price changes are provided in the *CPI Detailed Report* and *Producer Prices and Price Indexes*, both monthly publications of the Bureau.

As of January 1976, the Wholesale Price Index (as it was then called) incorporated a revised weighting structure reflecting 1972 values of shipments. From January 1967 through December 1975, 1963 values of shipments were used as weights.

For a discussion of the general method of computing consumer, producer, and industry price indexes, see *BLS Handbook of Methods for Surveys and Studies*, Bulletin 1910 (Bureau of Labor Statistics, 1976), chapters 13–15. See also John F. Early, "Improving the measurement of producer price change," *Monthly Labor Review*, April 1978, pp. 7–15. For industry prices, see also Bennett R. Moss, "Industry and Sector Price Indexes," *Monthly Labor Review*, August 1965, pp. 974–82.

---

[1] Prices for natural gas are lagged 1 month.

[2] Includes only domestic production.

[3] Most prices for refined petroleum products are lagged 1 month.

[4] Some prices for industrial chemicals are lagged 1 month.

[5] Not available.

NOTE: Data for August 1979 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication.

28. Producer Price Indexes, for special commodity groupings

[1967 = 100 unless otherwise specified]

Commodity grouping	Annual average 1978	1978	1979											
		Dec.	Jan.	Feb.	Mar.	Apr.	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.
All commodities — less farm products	208.4	216.3	219.3	222.0	224.7	228.0	230.1	232.0	235.4	237.5	241.0	244.9	246.7	249.2
All foods	206.4	215.5	219.9	225.0	225.9	227.7	226.4	223.8	225.4	224.7	228.2	226.6	229.9	232.1
Processed foods	208.7	215.7	219.6	223.5	225.6	227.8	227.5	224.7	228.4	224.8	230.6	229.9	231.8	234.1
Industrial commodities less fuels	197.2	204.6	207.3	209.6	211.9	214.7	216.0	217.0	219.0	220.3	221.6	225.4	226.4	228.1

NOTE: Data for Aug. 1979 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication.

PRODUCTIVITY DATA

PRODUCTIVITY DATA are compiled by the Bureau of Labor Statistics from establishment data and from estimates of compensation and output supplied by the U.S. Department of Commerce and the Federal Reserve Board.

Definitions

Output is the constant dollar gross domestic product produced in a given period. Indexes of **output per hour of labor input,** or labor productivity, measure the value of goods and services produced per hour of labor. **Compensation per hour** includes wages and salaries of employees plus employers' contributions for social insurance and private benefit plans. The data also include an estimate of wages, salaries, and supplementary payments for the self-employed, except for nonfinancial corporations, in which there are no self-employed. **Real compensation per hour** is compensation per hour adjusted by the Consumer Price Index for All Urban Consumers.

Unit labor cost measures the labor compensation cost required to produce one unit of output and is derived by dividing compensation by output. **Unit nonlabor payments** include profits, depreciation, interest, and indirect taxes per unit of output. They are computed by subtracting compensation of all persons from the current dollar gross domestic product and dividing by output. In these tables, **Unit nonlabor costs** contain all the components of unit nonlabor payments except unit profits. **Unit profits** include corporate profits and inventory valuation adjustments per unit of output.

The **implicit price deflator** is derived by dividing the current dollar estimate of gross product by the constant dollar estimate, making the deflator, in effect, a price index for gross product of the sector reported.

The use of the term "man-hours" to identify the labor component of productivity and costs, in tables 31 through 34, has been discontinued. **Hours of all persons** is now used to describe the labor input of payroll workers, self-employed persons, and unpaid family workers. **Output per all-employee hour** is now used to describe labor productivity in nonfinancial corporations where there are no self-employed.

Notes on the data

In the private business sector and the nonfarm business sector, the basis for the output measure employed in the computation of output per hour is Gross Domestic Product rather than Gross National Product. Computation of hours includes estimates of nonfarm and farm proprietor hours.

Output data are supplied by the Bureau of Economic Analysis, U.S. Department of Commerce, and the Federal Reserve Board. Quarterly manufacturing output indexes are adjusted by the Bureau of Labor Statistics to annual estimates of output (gross product originating) from the Bureau of Economic Analysis. Compensation and hours data are from the Bureau of Economic Analysis and the Bureau of Labor Statistics.

Beginning with the September 1976 issue of the *Review*, tables 31–34 were revised to reflect changeover to the new series—private business sector and nonfarm business sector—which differ from the previously published total private economy and nonfarm sector in that output imputed for owner-occupied dwellings and the household and institutions sectors, as well as the statistical discrepancy, are omitted. For a detailed explanation, see J. R. Norsworthy and L. J. Fulco, "New sector definitions for productivity series," *Monthly Labor Review*, October 1976, pages 40–42.

LABOR-MANAGEMENT DATA

MAJOR COLLECTIVE BARGAINING DATA are obtained from contracts on file at the Bureau of Labor Statistics, direct contact with the parties, and from secondary sources. Additional detail is published in *Current Wage Developments*, a monthly periodical of the Bureau. Data on work stoppages are based on confidential responses to questionnaires mailed by the Bureau of Labor Statistics to parties involved in work stoppages. Stoppages initially come to the attention of the Bureau from reports of Federal and State mediation agencies, newspapers, and union and industry publications.

Definitions

Data on wage changes apply to private nonfarm industry agreements covering 1,000 workers or more. Data on wage and benefit changes *combined* apply only to those agreements covering 5,000 workers or more. **First-year wage settlements** refer to pay changes going into effect within the first 12 months after the effective date of the agreement. **Changes over the life of the agreement** refer to total agreed upon settlements (exclusive of potential cost-of-living escalator adjustments) expressed at an average annual rate. **Wage-rate changes** are expressed as a percent of straight-time hourly earnings, while **wage and benefit changes** are expressed as a percent of total compensation.

Effective wage-rate adjustments going into effect in major bargaining units measure changes actually placed into effect during the reference period, whether the result of a newly negotiated increase, a deferred increase negotiated in an earlier year, or as a result of a cost-of-living escalator adjustment. Average adjustments are affected by workers receiving no adjustment, as well as by those receiving increases or decreases.

Work stoppages include all known strikes or lockouts involving six workers or more and lasting a full shift or longer. Data cover all workers idle one shift or more in establishments directly involved in a stoppage. They do not measure the indirect or secondary effect on other establishments whose employees are idle owing to material or service shortages.

35. Wage and benefit settlements in major collective bargaining units, 1975 to date
[In percent]

Sector and measure	Annual average					Quarterly average						
						1978			1979			
	1975	1976	1977	1978	1979	II	III	IV	I	II	III	IV

How to order BLS publications

PERIODICALS

Order from (and make checks payable to) Superintendent of Documents, Washington, D.C. 20402. For foreign subscriptions, add 25 percent.

Monthly Labor Review. The oldest and most authoritative government research journal in economics and the social sciences. Current statistics, analysis, developments in industrial relations, court decisions, book reviews. $18 a year, single copy, $2.50.

Employment and Earnings. A comprehensive monthly report on employment, hours, earnings, and labor turnover by industry, area, occupation, et cetera $22 a year, single copy $2.75.

Occupational Outlook Quarterly. A popular periodical designed to help high school students and guidance counselors assess career opportunities. $6 for four issues, single copy $1.75.

Current Wage Developments. A monthly report about collective bargaining settlements and unilateral management decisions about wages and benefits; statistical summaries. $12 a year, single copy $1.35.

Producer Prices and Price Indexes. A comprehensive monthly report on price movements of both farm and industrial commodities, by industry and stage of processing. $17 a year, single copy $2.25.

CPI Detailed Report. A monthly periodical featuring detailed data and charts on the Consumer Price Index. $15 a year, single copy $2.25.

PRESS RELEASES

The Bureau's statistical series are made available to news media through press releases issued in Washington. Many of the releases also are available to the public upon request. Write: Bureau of Labor Statistics, Washington, D.C. 20212.

Regional. Each of the Bureau's eight regional offices publishes reports and press releases dealing with regional data. Single copies available free from the issuing regional office.

BULLETINS AND HANDBOOKS

About 140 bulletins and handbooks published each year are for sale by regional offices of the Bureau of Labor Statistics (see inside front cover) and by the Superintendent of Documents. Washington, D.C. 20402. Make checks payable to the Superintendent of Documents. Among the bulletins and handbooks currently in print are these:

Occupational Outlook Handbook, 1978–79 Edition. Bulletin 1955. A useful resource supplying valuable assistance to all persons seeking satisfying and productive employment. $8, paperback; $11 hard cover.

BLS Handbook of Labor Statistics 1978. Bulletin 2000. A 604-page volume of historical data on the major BLS statistical series. $9.50.

Handbook of Methods. Bulletin 1910. Brief technical account of each major statistical program of the Bureau of Labor Statistics. $3.50.

BLS Measures of Compensation. Bulletin 1941. An introduction to the various measures of employee compensation; describes each series, the manner in which it is developed, its uses and limitations. $2.75.

Occupational Projections and Training Data. Bulletin 2020. Presents both general and detailed information on the relationship between occupational requirements and training needs. (Updates Bulletin 1918 published in 1976.) $3.25.

Technological Change and its Labor Impact in Five Energy Industries. Bulletin 2005. A 64-page study appraising major technological change and discussing the impact of these changes on productivity and occupations over the next 5 to 10 years. $2.40.

BLS Publications, 1972–77. Bulletin 1990. A numerical listing and subject index of bulletins and reports issued by the Bureau from 1972 through 1977, supplementing Bulletin 1749, covering 1886–1971. $1.80.

International Comparisons of Unemployment. Bulletin 1979. Brings together all of the Bureau's work on international unemployment comparisons. Describes the methods of adjusting foreign unemployment rates in 8 countries to U.S. concepts. $3.50.

REPORTS AND PAMPHLETS

Single copies available free from the BLS regional offices or from the Bureau of Labor Statistics, U. S. Department of Labor, Washington, D.C. 20212.

Occupational Injuries and Illnesses in 1977: Summary. Report 561. Statistical estimates of incidence rates for and number of occupational illnesses and injuries in the United States during 1976 and 1977.

How the Government Measures Unemployment. Report 505. A concise report providing a background for appraising developments in the area of unemployment.

Where to Find BLS Statistics on Women. Report 530. A summary of the statistics on women which are available from the Bureau of Labor Statistics and where they may be found.

Directory of BLS Studies in Industrial Relations 1960–78. Report 550. A listing of studies prepared by the Division of Industrial Relations as part of the Bureau's regular program of data collection and analysis in the field of industrial relations.

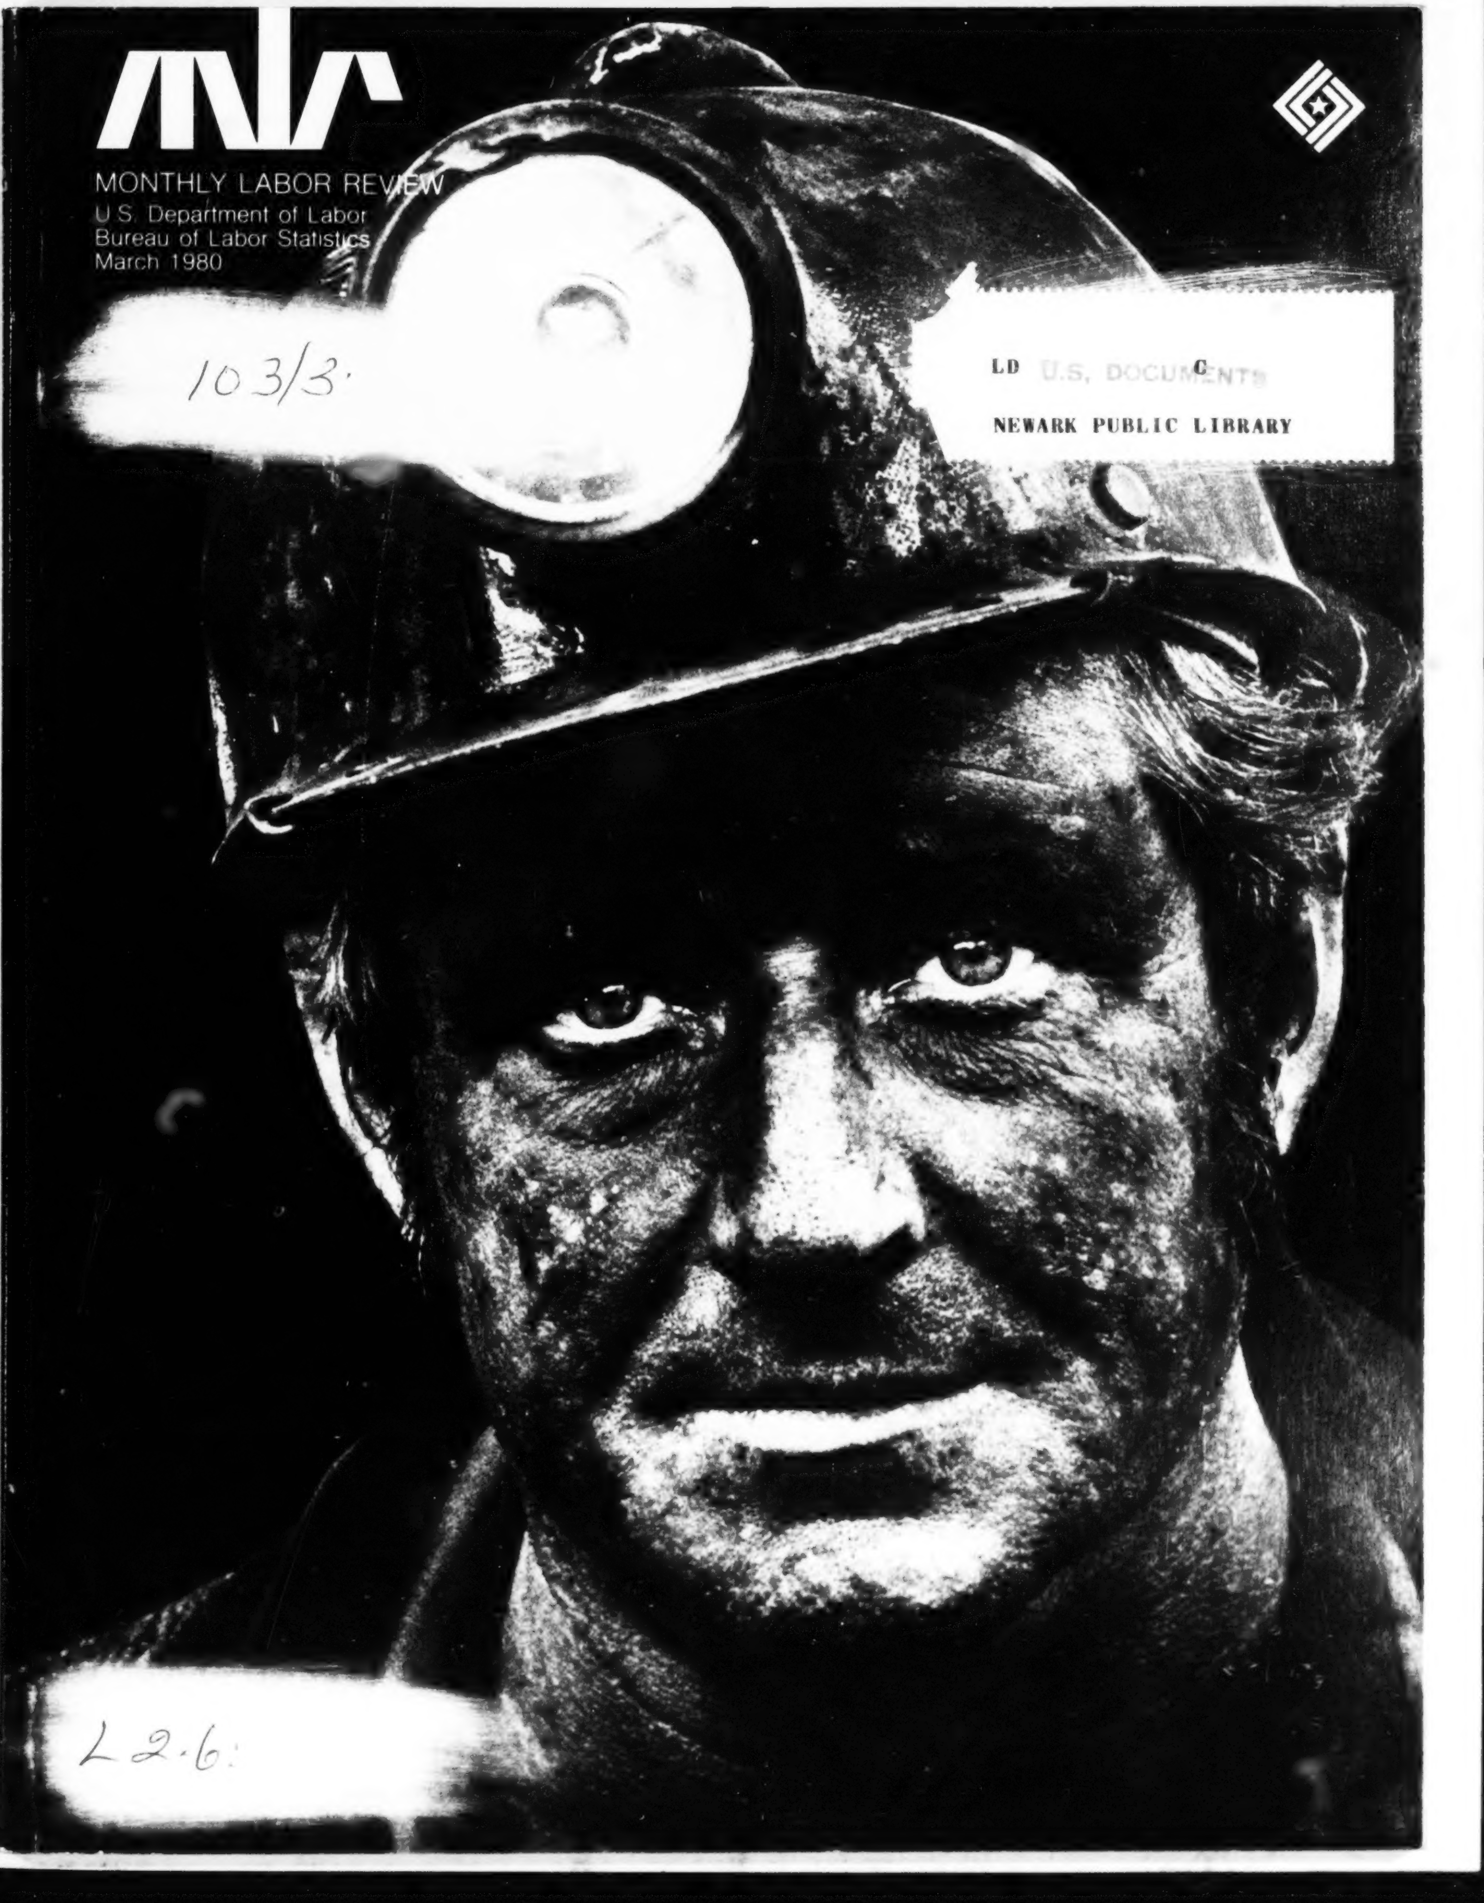
NEWARK PUBLIC LIBRARY



L2.6:

U.S. DEPARTMENT OF LABOR
Ray Marshall, *Secretary*

BUREAU OF LABOR STATISTICS
Janet L. Norwood, *Commissioner*

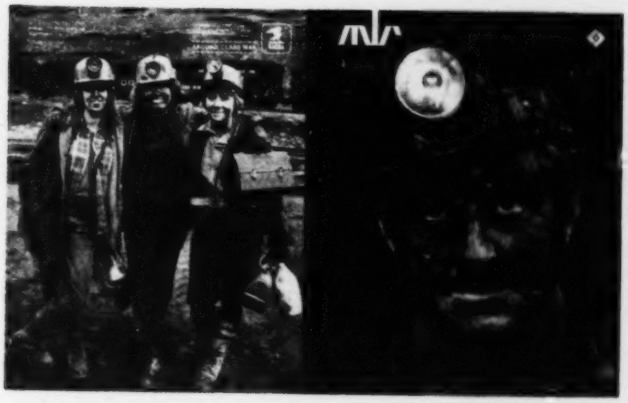
The Monthly Labor Review is published by the Bureau of Labor Statistics of the U.S. Department of Labor. Communications on editorial matters should be addressed to the Editor-in-Chief, Monthly Labor Review, Bureau of Labor Statistics, Washington, D.C. 20212.
Phone: (202) 523-1327.

Subscription price per year—
$18 domestic; $22.50 foreign.
Single copy $2.50.
Subscription prices and distribution policies for the Monthly Labor Review (ISSN 0098-0818) and other Government publications are set by the Government Printing Office, an agency of the U.S. Congress. Send correspondence on circulation and subscription matters (including address changes) to:
Superintendent of Documents,
Government Printing Office,
Washington, D.C. 20402

Make checks payable to
Superintendent of Documents.

The Secretary of Labor has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through October 31, 1982. Second-class postage paid at Riverdale, MD., and at additional mailing offices.

Library of Congress Catalog
Card Number 15-26485



March covers:

Photos by Earl Dotter, from *In Mine and Mill: A Photographic Portfolio of Coal Miners and Textile Workers,* 20 plates, 11" × 17", copyright by Earl Dotter, Pilgrim Press, 132 West 31st Street, New York, N.Y. 10001, $15. Dotter's workplace photos, emphasizing both the dignity and the dehumanizing aspects of work, have been widely exhibited and have been compared to those of Lewis Hine. Most recently, the coal and textile photographs were selected for exhibition at Gallery 1199, New York City, and at the Venezia la Fotografia '79.

Labor Month In Review

MINORITIES REPORT. The Bureau of Labor Statistics published the first in a new series of fact sheets on employment and unemployment of blacks and Hispanics.

Commissioner of Labor Statistics Janet L. Norwood explained that the new series, to be issued quarterly, "is part of the Bureau's continuing effort to increase public understanding and awareness of the special employment problems of blacks and Hispanics."

Forthcoming issues will deal with such topics as occupations of black and Hispanic workers, the earnings gap between minorities and whites, minority labor force participation trends, and the differences in employment status among Puerto Ricans, Cubans, Mexicans, and other Hispanics in the U.S. workforce.

Here are excerpts from the first issue of *Employment in Perspective: Minority Workers:*

Minority unemployment. Blacks and Hispanics—the Nation's two largest minorities—are much more likely than whites to be unemployed. In the fourth quarter of 1979, the jobless rates for blacks, 11.4 percent, and Hispanics, 8.6 percent, were both substantially higher than for white workers, 4.9 percent.

Age-sex breakdowns provide more insight into the high unemployment rates among minorities vis-a-vis whites. For teens, young adults, and men 25 years and over, black unemployment rates were more than double the comparable white rates, with the largest disparity occurring among workers under 25. Unemployment rates for Hispanics were also above those for whites, but lower than those for blacks. Hispanics 25 years and over, however, experienced higher unemployment rates relative to their white counterparts than those under 25. Unemployment rate ratios for black and Hispanic workers by age relative to their white counterparts for the fourth quarter of 1979 are as follows:

	Black/white ratio	*Hispanic/white ratio*
Total, 16 years and over	2.3	1.8
Men, 16 and over . .	2.5	1.6
16-19 . . .	2.5	1.2
20-24 . . .	2.5	1.4
25 and over. . . .	2.5	1.7
Women, 16 and over. . .	2.1	2.0
16-19 . . .	2.9	1.8
20-24 . . .	2.9	1.8
25 and over. . . .	1.7	2.0

The incidence of joblessness varied substantially among the three main Hispanic ethnic groups. Both Puerto Ricans and Mexicans had unemployment rates (10.5 and 9.1 percent, respectively) above the overall Hispanic rate, while the Cuban rate (6.6 percent) was the lowest among workers of Hispanic descent. These variations reflect differences in age composition, educational level, and residential patterns of the three groups, as well as other factors. Thus, Cubans, who are, on the average, older and have completed more years of schooling than other Hispanics, generally had the lowest unemployment rates among the specific minority age-sex groups.

Reason for unemployment. The distribution of unemployment according to reason (status at the time a person became unemployed) differed substantially, between the minority groups. A greater proportion of unemployed blacks than Hispanics were new entrants or reentrants into the labor force. On the other hand, Hispanics were much more likely than blacks to be job losers. Among the Hispanic subgroups, about half of the unemployed Puerto Ricans and Mexicans were job losers. In contrast, the proportion of unemployed Cubans who were job losers was essentially the same as for blacks.

Duration of unemployment. Differences between blacks and Hispanics are also evident in their duration of unemployment (the length of a current spell of unemployment). As shown in the following tabulation for the fourth quarter of 1979, blacks were considerably more likely to experience long-term unemployment (over 15 weeks) than were Hispanics, and more than half of the unemployed Hispanics were jobless for less than 5 weeks.

	Black and other	*Hispanic*	*White*
Total (percent) . . .	100.0	100.0	100.0
Less than 5 weeks . . .	42.0	52.4	50.0
5-14	34.3	33.6	32.4
15 or more .	23.7	14.0	17.6
15-26	11.8	10.6	10.4
27 or more	11.8	3.2	7.2
Median (in weeks)	7.1	4.8	5.0

Employment in Perspective: Minority Workers is available without charge from the Office of Publications, Bureau of Labor Statistics, Washington, D.C. 20212, and from the Bureau's regional offices.

Recent trends in worktime: hours edge downward

Changing composition of work and the work force, union contracts, and Federal laws all contributed to reductions in weekly hours from 1968 to 1979; time off for vacations and holidays increased

JANICE NEIPERT HEDGES AND DANIEL E. TAYLOR

Weekly hours of full-time workers averaged about one-half hour less per week in May 1979 than 11 years earlier. For both men and women, workweeks of 35 to 39 hours were a little more prevalent and those of 41 to 48 hours less prevalent than in 1968. And, when part-time workers are included in the average, the workweek declined slightly more. These modest reductions reflect a variety of factors, including changes in the labor force, shorter work schedules, and the growth of paid leave.

The average number of vacation days taken by workers increased only marginally during this period. Because vacation leave generally is based on length of service, the influx of women and youth—groups with less than average job tenure—as well as the earlier retirement of senior workers postponed the full effect of liberalized benefits.

This article examines movements in worktime from 1968 to 1979 for answers to these questions: Are average weekly hours for U.S. workers static or changing? Are trends the same for men and women, young and old, white and black? What do comparisons among occupations and industries show? What are the trends in scheduled hours, overtime or extra hours, and in paid leave? What are the average hours of work per year?

Unless noted, data are from the Current Population Survey, a national survey of households which collects information monthly on the labor force.[1] Included in the data on hours at work are hours on second jobs, with total hours credited to the principal job. (Workers absent from their jobs for the entire survey week are excluded from the computation of averages or distributions of hours worked.) The data refer to nonagricultural wage and salary workers, except where specified.

Work-leisure tradeoff

A brief look at the economic theory generally used to examine hours of work may help to put changes in worktime in perspective. The basic theory rests on the premise that gains in productivity are available for distribution to workers in the form of higher earnings or fewer hours, or in some combination of the two. The concept of a tradeoff that workers make between work and leisure as wages rise was formalized by Lionel Robbins in 1930 and developed by H. G. Lewis and others.[2]

According to this theory, a rise in the real wage rate has two effects on the number of hours that workers supply, effects that pull in opposite directions. One effect is for workers to use the additional money to "purchase" more leisure time, along with other goods and services—the income effect. The other is for workers to seek to increase their worktime, because time off costs more in earnings forgone—the substitution effect.

Dividing time solely into market time and leisure time, however, ignores other categories, such as time spent on household duties and child care. Gary Becker and others have integrated this category ("time spent producing goods and services in the household for household consumption") into the basic theory.[3] This concept sheds light on the work-hours decisions of

---

Janice Neipert Hedges and Daniel E. Taylor are economists in the Office of Current Employment Analysis, Bureau of Labor Statistics.

women, who continue to spend more time on household production than men,[4] and helps to explain the relationship between the hours worked by various members of a household:

> Members who are relatively more efficient at market activities would use less of their time at consumption activities than would other members. Moreover, an increase in the relative market efficiency of any member would effect a reallocation of the time of all other members toward consumption activities in order to permit the former to spend more time at market activities.[5]
>
> . . . most Americans live in family units where some pooling of income and sharing of home tasks occurs, and where decision-making on labor supply involves some degree of joint consultation.[6]

Although estimates of the relative impact of the income and substitution effects vary, Lewis observed a general agreement that among married men, a 1-percent increase in the wage rate would result in the long run in about a 0.15-percent decrease in hours. That is, this group has tended to purchase additional time off with about 15 percent of a potential pay increase.[7] In contrast, women devote additional time to market work when wages rise, drawing from both leisure and household worktime.[8]

The income and substitution effects vary in response to changes in family formation and size, value systems and tastes, occupation and industry structure, and other factors. Since 1968, full-time employees have reduced their workyear by about 39 hours, or one-sixth of the reduction made possible by productivity gains.[9] A recent national survey on the preferences of workers for higher earnings versus fewer hours indicated that the majority expressed greater interest in additional leisure time than in a 10-percent gain in earnings.[10]

The complex interplay between wages and hours of work is described by Sherwin Rosen:

> . . . working hours become part of the nonpecuniary aspects of employment that affect its net attractiveness in the market . . . there must be a different hourly wage struck for each possible work schedule. That is, there is not a single labor market at all . . . but rather a spectrum of closely interconnected markets geared to different work schedules . . . one market for long hours, one for full-time jobs, one for short hour jobs, one for part-year jobs, and so on.[11]

The flexibility of schedules is an important aspect of employment for many exployees:

> . . . rigid schedules mean that workers are supplying more time or at least a distribution of time that imposes more costs upon them than would hours freely chosen by themselves.[12]

The demand for hours of work is affected by the cost of labor in relation to the cost of other inputs, such as machines and materials. The length of work schedules is affected by technological requirements of the job and the need for hours convenient to customers. Also, public laws and collective bargaining agreements that call for premium pay over a maximum number of hours per day or per week or for late-shift or weekend work have an impact on work schedules.

Historical experience. From 1900 to 1946, the average workweek shrank from about 53 to 44 hours. Productivity growth and declining agricultural employment underlay this trend, which was rapid in some periods and arrested, or even reversed, in others. For example, the average workweek declined substantially during the Great Depression, as work-sharing efforts led to Federal legislation which set the standard workweek and workday (beyond which premium pay was required) below the pre-Depression level. During World War II, average weekly hours lengthened, but government controls on wages coupled with competition for workers resulted in substantial gains in paid vacations.[13]

Since the 1940's, worktime has been further reduced by the growth of service industries and the continued decline of agriculture and the increased employment of women and youth. Rising expectations and inflation probably have exerted counter pressures. On balance, hours reductions have proceeded slowly. Some analysts, considering only the hours of men have concluded that little or no change in weekly hours has occurred in the United States in the post-World War II era.[14]

Recent trends

The average workweek for nonagricultural wage and salary employees who usually work full time declined from 43.0 to 42.6 hours, or nearly half an hour between May 1968 and May 1979. The decline reflected a decrease of almost 3 percentage points in the proportion of persons at work 41 to 48 hours, with a commensurate increase in the proportion at work from 35 to 39 hours.

The increased prevalence of women and youth in the work force and the growth of industries with shorter than average workweeks contributed to the reduction in weekly hours. Other factors included changes in the Fair Labor Standards Act (FLSA) and in collective bargaining agreements and an increase in unemployment.[15]

Average weekly hours reported by all nonagricultural wage and salary workers (including part-time workers) declined from 39.1 to 38.5 hours, or a little more than half an hour. This reduction reflected the shorter hours for workers on full-time schedules and the more rapid growth of part-time than of full-time workers.

Both men and women were more likely to work part time in 1979 than in 1968. The largest group of part-time employees—those who usually work part time by choice—increased from 13.0 to 13.8 percent of all workers. The other groups of part-timers, those who usually work full time but fell into the part-time category during the reference week because of time off and those who worked part time for economic reasons (such as slack work or material shortages), also grew faster than full-time workers. All part-timers increased from 19.4 to 22.2 percent of all employees. Partially offsetting the relative growth in part-time work was an increase (from 17.5 to 18.9 hours per week) in the average hours of those who usually work part time, a pattern which was similar for men and women.

The downward trend in hours worked reported by the household survey is corroborated by other data series. For example, payroll data for the same period showed a decline from 37.7 to 35.5 in hours paid all production and nonsupervisory workers in private industry. Wage survey data on the average length of majority schedules in establishments in metropolitan areas showed a decline from 40.5 to 40.1 hours for plantworkers and from 38.9 to 38.7 hours for officeworkers from 1968 to 1976.

Although economic systems and labor force statistics vary by country, available information on workweeks in Canada and Western Europe also shows hours reductions in the past decade. For example, manufacturing workers in Canada averaged 38.9 hours of work per week in May 1979, down from 40.6 hours in May 1968. The workweek in manufacturing industries declined from 41.8 to 40.0 hours in Great Britain during this period; in Germany, the workweek in manufacturing averaged 32.8 hours in 1978, down from 36.4 hours in 1970. Average weekly hours of all nonagricultural wage and salary workers in Sweden decreased from 39.0 hours in 1968 to 35.4 hours in 1978. And in France, scheduled weekly hours for full-time workers in private nonagricultural industries declined from about 45 hours in 1970 to 41 hours in 1978.[16] At the same time, European workers have maintained their traditional advantage over U.S. workers in regard to holidays and vacations. For example, a minimum 1 month of annual vacation for all workers is required by law in France and Germany.

Men and women, by age. Among full-time U.S. workers, both men and women in most age groups worked slightly shorter workweeks in 1979 than their counterparts in 1968. Men 25 to 34 years of age reported larger declines of more than one-half hour per week. (See table 1.) Because this group represented almost one-fifth of all full-time employees in May 1979, their hours reduction figured importantly in the reduced overall average.

Men in their early 20's who worked full time in 1979 reported about the same weekly hours as their counterparts in 1968. A decline in the hours of this group may have been averted by the declining proportion enrolled in school (from 19.3 to 16.0 percent), because nonenrollees are almost 3 times more likely than enrollees to work more than 40 hours per week.

When part-time workers are included, the average workweek of all men 25 to 34 declined even more, by nearly 1 hour. However, all men in the 20 to 24 and 16 to 19 age brackets experienced increases of 0.4 and 2.1 hours, again probably due to decreased school enrollments. An increase of a little less than a half hour in the workweek of women ages 25 to 34 (who account for more than one-fourth of all women workers) was offset by decreases among women ages 20 to 24 and those over 45.

Changes in the sex and age composition of workers also impacted on hours. The growth in the employment of women and the entry into employment of exceptionally large numbers of youth—as the population born in the decade following World War II came of age—both contributed to the decline in the length of both full-time workweeks and all workweeks. During the period, women increased their labor force participation rate from 41.6 to 50.1 percent, and the median age for all workers declined from 39.5 to 35.4 years.

. . . and marital status. Among married workers on full-time schedules (including the self-employed), weekly hours were down by nearly one-half hour for men and a little more than that for women. The increasing prevalence of working couples, with their higher family incomes, may have contributed to the decline in hours for husbands. Married and single (never-married) women also worked slightly shorter weeks in 1979 than in 1968, while no trend was apparent in the hours of single men.

The trends are similar when all workweeks are considered, except for an increase of more than 2 hours in the workweek of single men, a group mostly consisting of young men. Again, declining school enrollment for this group may largely account for their additional hours. Following are average weekly hours of married and never-married men and women in May 1968 and 1979:

	Men		*Women*	
	Never married	*Married*	*Never married*	*Married*
Full-time schedules:				
1968	42.5	45.5	40.8	40.8
1979	42.6	45.1	40.3	40.2
All schedules:				
1968	33.5	44.5	32.9	34.9
1979	35.9	43.8	32.6	34.4

Race. Black workers who were employed full time worked almost 1 hour less per week on average in May 1979 than 11 years earlier, compared with a decline of little more than one-quarter hour for their white counterparts.[17] The increased share of jobs held by women was a factor in shorter hours for full-time workers of either race. Nonetheless, the workweek declined substantially for both black men and women.

The relatively large, although declining, representation of black workers in the service occupations, in which average weekly hours declined more than in any other occupation, was a factor in the hours reductions for the race. However, an increased proportion of black employees in professional and managerial positions, occupations having higher than average workweeks, partially countered this effect.

When all schedules are considered, the average workweeks of white men and women decreased only slightly. Workweeks for black men were reduced by nearly 1 hour. The lengthened workweeks of black women may be partially explained by the 1970–78 increase of nearly two-thirds in the number heading families.

Occupation and industry. Service employees at work full time reported a decline of about 2 hours in their workweek from 1968 to 1979. In May 1968, they worked about one-half hour more per week than all full-time workers; 11 years later they worked 1 hour less. (See table 2.)

The workweek of full- and part-time service employees combined also declined. In 1968, the average workweek for all service workers was about 5.6 hours shorter than the all-occupation average; in 1979, the gap was 6.5 hours.

Amendments to the FLSA in 1974 and 1977 which brought about 7 million additional workers,[18] many of them service employees, under the overtime provisions of the act, contributed to shorter hours for this occupational group. The 1977 amendments also lowered certain overtime exemptions for employees of hotels,

motels, and restaurants from 46 to 44 hours per week, effective January 1, 1978, and to the general 40-hour standard, effective January 1, 1979.[19] Collective bargaining agreements were another factor in shorter hours, especially in reducing the very long workweeks for protective service workers, such as police and firefighters.[20] The particularly rapid growth of food service jobs, in which shorter weeks are the norm, also played a part in reducing average hours for the service group.

Smaller changes were reported for factory and other operatives, professional and technical workers, and salesworkers. For these groups, average full-time workweeks declined from one-half to one hour from 1968 to 1979. Hours for all employees, including part time, trended down in clerical and craft occupations.

The most accurate national data on trends in the workweek by industry are provided by the payroll survey. As noted earlier, data from this survey show that production and nonsupervisory workers in private industry averaged 35.5 paid hours in May 1979, down 2.2 hours since May 1968. See table 3.) The sharpest reductions occurred in trade and in services, down 3.3 and 2.0 hours. Hours paid in manufacturing declined by .8 hour.

Scheduled hours, as distinguished from paid hours, declined substantially in trade and services for nonoffice, but not for office workers in metropolitan areas. In most industries, however, the length of scheduled workweeks edged down. The following wage survey data show scheduled weekly hours for selected industries:

	Office			*Nonoffice*		
	1967–68	*1972–73*	*1976*	*1967–68*	*1972–73*	*1976*

NOTE: Detail may not add to totals due to rounding.

overtime work, although the right of workers to refuse overtime has been the subject of collective bargaining, as has their right to a fair share of overtime.[21] Management may order overtime to meet temporary or sporadic demands for products or services, but the decision often is based on the cost of premium pay versus the cost of hiring, training, and providing fringe benefits to additional employees.

Data from the household survey show that of the almost 19 million full-time wage and salary workers who worked 41 hours or more a week in May 1979, about 8 million were on overtime for which they received premium pay. Workweeks in excess of the standard were more prevalent than in 1975 or 1976 but below 1973 levels, the first year for which comparable data are available.[22] Overtime hours in manufacturing, from the payroll series, averaged 3.6 hours per worker in 1978, the same as in 1968.[23]

About 4.3 million nonagricultural wage and salary employees in May 1979 extended their workweek by moonlighting.[24] Some worked only part time on both jobs; however, about three-fourths worked 35 hours or more on their primary jobs and about 8 percent worked full time on both jobs. For all moonlighters, median hours on a second job were 13 a week and hours on both jobs, about 51.

The proportion of nonagricultural wage and salary workers holding more than one job was 4.9 percent in May 1979, about the same as in May 1969. There was no change in hours on the second job, but average worktime for multiple jobholders on all jobs declined by about 2 hours. The decrease is explained by the higher proportion of multiple jobholders who were women, as well as decreases in hours of moonlighting men.

The stability in multiple jobholding rates over the period masks some striking changes in the characteristics of the group. In 1979, women accounted for 30 percent of multiple jobholders, up from 17 percent in 1969. This change was the result of a rise in women's multiple jobholding rate (from 2.3 to 3.6 percent) and a decline in the rate for men (from 7.2 to 5.8 percent). Rates were up for women irrespective of their marital status but declined for men, except those who were single. (Particularly rapid declines in multiple jobholding for men 25 to 34 years and for black men contributed to the shorter weekly hours for these groups.)

Table 3. Average hours paid production and nonsupervisory workers in the private nonagricultural economy, by industry, May of 1968, 1978, and 1979

Industry	Number of workers (in thousands)			Average weekly hours

Time off

On the other side of the ledger, hours are affected by absences of various types, including sick and personal leave, holidays, and vacations. Although not all absences are paid, paid leave hours accounted for 7.6 percent of all paid hours in 1977, up from 6.2 percent in 1968.[25]

Among full-time wage and salary workers, absences for illnesses and injuries amounted to the loss of 2.3 percent of usual hours in May 1978. Part-week absences accounted for 0.8 percent; full-week absences for 1.5 percent. Both figures were about the same as 5 years earlier, when data on hours lost as a result of illnesses and injuries were first available. Workers in the goods-producing sector reported a greater proportion of time lost than those in the service-producing sector, women lost a greater proportion than men, and older workers, more than youth.[26]

Other personal reasons accounted for additional absences and lost worktime. These include illnesses and injuries of family members, maternity leave, funerals, and leave for jury duty, court witness, or military service. In May 1978, absences for such reasons were about 1.2 percent of aggregate usual hours, with the loss distributed equally between part- and full-week absences.[27]

Time lost because of illnesses and injuries and personal reasons combined appears to fluctuate with the economic cycle and the seasons.[28] Part-week absences declined during the 1974–75 recession and have since resumed their prerecession level. Monthly data on the incidence of absences show a seasonal pattern, with absences most prevalent in January and least in September.

Payment for absence from work because of illnesses or injuries was available to 8 of 10 plantworkers and officeworkers in 1976, about the same as in 1968, according to the wage survey. Paid personal leave also is available to many workers: of 1,570 major collective bargaining agreements in 1976, two-thirds provided funeral leave, and the same proportion provided leave for jury duty. The agreement negotiated by the United Auto Workers and the automobile industry in 1979 provided for 26 personal days off, spread over 3 years.[29]

Paid holidays also have increased in recent years. According to data from the wage survey, average holidays provided office and other workers in metropolitan areas increased by 1.3 days from 1968 to 1976, bringing paid holidays to 9.4 days for officeworkers and 8.9 days for other workers. Manufacturing employees experienced the largest gains, with an increase from 7.9 to 9.6 days for plantworkers and from 8.2 to 10.0 days for officeworkers.[30]

Vacations lengthen. By 1968, virtually all plantworkers and officeworkers in metropolitan areas worked in establishments that provided paid vacations. The major development since then has been the liberalization of vacation provisions. In 1976, 35 percent of the plantworkers were eligible for a vacation of 2 weeks or more after 1 year of service, up from 25 percent in 1968, according to data from the wage survey. Among officeworkers, the proportion eligible for 2 weeks or more vacation after that length of service increased from 78 to 82 percent.[31]

According to the household data, the average length of vacations received by workers in the United States in 1979 was slightly higher than in 1968, increasing from 1.9 to 2.0 weeks.[32] Length of service—the basis for vacation eligibility in the United States—declined from 3.8 years in 1968 to 3.6 years in 1978 as a result of the flow of youth and women into the labor force, together with a trend toward earlier retirement.[33] In 1978, the proportion of the employed with 1 year or less on the job was 27 percent, up from 25 percent in 1968.

The growth in annual vacation benefits apparently has not kept pace with workers' desires for vacation time. From 1968 to 1979, full-week vacations taken without pay rose as a percent of all full-week vacations from about 14 to 20 percent for men and from 34 to 39 percent for women, based on household data. The seasonal distribution of vacations has shifted in recent years. June, July, and August accounted for about 60 percent of all vacations in 1979, down from 70 percent a decade earlier. The number of vacations still tapered off toward winter, reaching the lowest point in January, then gradually increasing in the spring. (See table 4.)

Extended vacations, usually from 10 to 13 weeks taken at regular intervals (for example, every 5 years), supplement annual vacations for some long-service employees. Such vacations or "sabbaticals" were first used in higher education. About 5 percent of all major collective bargaining agreements in 1976 included provisions for extended vacations, with most of the covered workers employed in primary metals industries.[34]

The workyear

The growth in time off for vacations, holidays, personal and other types of leave may eventually require that worktime be measured in hours per year. Furthermore, average weekly hours are increasingly difficult to interpret as work schedules that vary in length from week to week without affecting total hours over a longer period become more prevalent. Flexitime systems that permit workers to bank extra hours in one week for use in another are but one new element in a mix of workweeks that already included full-time schedules, part-time schedules of several types, and part-year schedules.

Table 4. Number of vacation weeks, by seasonal distribution, 1968 and 1979

Item	1968	1979
Number of weeks, in millions	106.6	147.8

August	27	23
September	7	6
October	4	5
November	3	4
December	3	3

NOTE: Detail may not add to totals due to rounding.

Limited data on annual hours are available. A Bureau of Labor Statistics survey of establishments, conducted to obtain data on work-related injuries and illnesses, indicates that annual worktime in 1977 for all workers averaged 1,735 hours in private nonagricultural industries and 1,914 hours in manufacturing.[35] Annual hours for those wage and salary employees who work full time, year round can be roughly estimated from household data, using usual weekly hours adjusted for vacations, holidays, and sick and personal leave, together with the number of weeks worked per year.[36] The result suggests that in 1977 the average full-time, year-round employee worked about 2,060 hours. Estimates for men averaged nearly 200 more hours than for women. However, male-female differences varied by age, increasing for consecutive age groups through the late thirties and early forties, then diminishing as the workweek remained constant for women and decreased for men. The United Auto Workers reports that scheduled hours per year for full-year workers in unionized automobile factories averaged 1,752 hours in 1979, a decrease of more than 6 percent from 1967 figures.[37]

Time worked can be viewed in an even broader perspective, that of years of work over the life span. In 1970, the estimated length of worklife, based on labor force participation rates by age, was about 40 years for men and a little more than half that for women. Estimated worklife a decade earlier, using the same methodology, was 1 year longer for men and 3 years shorter for women.

WORKTIME SINCE 1968 for wage and salary employees in the United States has declined slightly, because of shorter weekly schedules and more time off. Among the groups with larger than average reductions in weekly hours were men age 25 to 34 years, black men, and workers employed in service occupations, and in the retail trade and service industries. Changes in industry and occupational structure, in the composition of the labor force, as well as in Federal laws and collective bargaining agreements contributed to the gradual decline in worktime over the period. ☐

——*FOOTNOTES*——

ACKNOWLEDGMENT: Shirley Smith of the Office of Current Employment Analysis, Bureau of Labor Statistics provided tabulations from her research on the worklife of men and women, which the authors adjusted to obtain estimated annual work hours for year-round, full-time workers. Rosanna P. Sockwell and Bernadine F. Finstad provided statistical assistance.

[1] The Current Population Survey is conducted by the Bureau of the Census for the Bureau of Labor Statistics, using a national sample of households, numbering about 56,000 in 1979. The primary question on hours worked is:

> How many hours did . . . work LAST WEEK at all jobs?

Household data on hours at work are supplemented with data from other surveys conducted by the Bureau of Labor Statistics. The best known of these is the Current Employment Survey (or the payroll series), a monthly survey of business firms conducted in cooperation with State Employment Security agencies. This survey's coverage in terms of hours is limited to production and nonsupervisory workers on private nonfarm payrolls. (For a detailed discussion of the differences between the household survey and the payroll series, see Richard M. Devens, Jr., "The average workweek: two surveys compared," *Monthly Labor Review*, July 1978, pp. 3–8.) Another source for data on workhours is the Area Wage Survey, which provides data on the average scheduled workweek in metropolitan areas. The scope and methods of this survey are described in *Area Wage Survey, Metropolitan Areas, United States and Regional Summaries, 1976*, Bulletin 1900–82 (Bureau of Labor Statistics, 1979), pp. 110–14. Although the level of hours reported from these several sources varies because of differences in concepts, coverage, and other details, the trends have been similar.

[8] Reuben Gronau, "Leisure, Home Production, and Work—The Theory of the Allocation of Time Revisited," *Journal of Political Economy*, 1977, pp. 1099–1123.

[9] This estimate is based on a methodology similar to that used by Peter Henle in "Recent Growth of Paid Leisure for U.S. Workers," *Monthly Labor Review*, March 1962, pp. 249–57 and by Geoffrey Moore and Janice Hedges in, "Trends in labor and leisure," *Monthly Labor Review*, February 1971, pp. 3–11. Essentially, the increase in output per hour over the period is translated into a potential reduction of annual hours, holding total output levels the same in each year. The 39 hours decrease in annual hours since 1968 is distributed as follows:

shorter workweek	25 hours
additional vacation	4 hours
additional holidays	10 hours

Henle suggested an alternative methodology, comparing the actual output in the last year of a period with the output that would have been produced given the productivity level in the first year in the period. This method involves comparing average annual hours in both years. He noted that either methodology resulted in essentially the same outcome for the period he was concerned with, 1940 to 1960. However, the changing labor force composition in the 1960's and 1970's has meant a reduction in average hours resulting not only from additional leisure but also from the increase in the relative importance of the part-time work force. For instance, women entering the labor force often obtain jobs which require shorter schedules than those of men.

[10] Fred Best, *Exchanging Earnings for Leisure: Findings of an Exploratory National Survey on Work Time Preferences* (Washington, National Commission for Employment Policy, 1978). The national sample consisted of 1,560 persons, representative of all workers age 17 years and older in the civilian population.

[13] For a discussion of these trends, see John D. Owen, *Price of Leisure* (Montreal, McGill-Queens' University Press, 1970), pp. 69–71.

[14] See John D. Owen, "Workweeks and leisure: an analysis of trends, 1948–75," *Monthly Labor Review*, August 1976, pp. 3–7, and Thomas J. Kniesner, "The Full-Time Workweek in the United States, 1900–1970," *Industrial and Labor Relations Review*, October 1976, pp. 3–15.

[15] The rise in the unemployment rate from 3.8 percent in May 1968 to 5.8 percent in May 1979 shows a general decline in the equilibrium of labor demand and supply. The relationship between unemployment and hours can be made clearer by considering those working part time for economic reasons. See, for example, Robert W. Bednarzik, "Involuntary part-time work: a cyclical analysis," *Monthly Labor Review*, September 1975, pp. 12–18. Involuntary part-time workers have increased from 2.1 percent of all wage and salary workers in May 1968 to 3.3 percent in May 1979.

[16] Canadian data are from *Employment, Earnings and Hours, July 1979* and *Man-Hours and Hourly Earnings, May 1968*, published by Statistics Canada. Data for Europe were prepared for this article by

the Office of Productivity and Technology, Bureau of Labor Statistics. They are not comparable among countries.

[17] In this report, the term black refers to blacks and others who identified themselves in the enumeration process as other than white. At the time of the 1970 Census of Population, 89 percent of the group were black; the remainder included American Indians, Alaskan natives, and Asian and Pacific Islanders.

[31] *Area Wage Survey,* pp. 102–03.

[32] These estimates were calculated for full-time workers who responded to the following questions by stating they were on vacation:

What is the reason . . . worked less than 35 hours LAST WEEK?
Why was . . . absent from work LAST WEEK?

[33] Edward S. Sekscenski, "Job tenure declines as work force changes," *Monthly Labor Review,* December 1979, pp. 48–50.

[34] *Characteristics of Major Collective Bargaining Agreements, July 1, 1976,* table 5.5.

[35] Unpublished data. Annual hours *paid* per job in nonagricultural industries were reported as 1,903 in 1977, down from 1,981 in 1968. See Norman C. Saunders, "The U.S. economy to 1990: two projections for growth," *Monthly Labor Review,* December 1978, p. 36–46.

[36] The calculations of annual hours were based on tabulations prepared in conjunction with Bureau of Labor Statistics research on the work life of men and women. These data were adjusted to exclude estimated hours on vacation, holiday or other leave. Two weeks vacation, 7 holidays, and an absence rate of 2.3 percent of usual hours for illnesses and injuries and 1.2 percent for miscellaneous personal reasons were assumed per worker.

[37] Howard Young, "Jobs, Technology, and Hours of Labor: the Future of Work in the U.S.," a paper presented at hearings of the Joint Economic Committee's Special Study on Economic Change, June 14, 1978. Unpublished UAW data for 1979.

Better working conditions bring on shorter hours?

A number of explanations can be and have been offered for the leveling off in hours of work. Some argue simply that the achievement of an 8-hour day has so reduced the marginal gain from additional leisure as to make future reductions in hours unlikely. This view has some merit in a discussion of daily hours, but does not afford an explanation of the present interest in reducing hours by obtaining more days off per year.

Others believe that while the number of hours worked has shown little change, there has been a reduction in the intensity of work and an improvement in working conditions, reducing the demand for further cuts in hours scheduled. It is extremely difficult to make meaningful comparisons over time of the intensity of work, partly because the necessary data are not collected, partly because the nature of work demands has itself been influenced by technological change, so that less emphasis is now placed on the intensity of physical effort and more on responsible, dependable behavior. On the other hand, there is little doubt that there has been an improvement in working conditions, and that this has been an additional factor influencing the level of working hours.

Moving to the sun: regional job growth, 1968 to 1978

In a decade, sunbelt economies grew fastest: favorable business climates and increased Federal contract dollars helped expand job opportunities that, along with environmental factors, created a large migration from the North

PHILIP L. RONES

Interregional migration has been one of the dominant forces associated with economic progress in the United States. At the heart of the great interregional migrations in this country has always been the search for economic advantage. This was true whether the search was made by the family moving to Ohio to farm in the 1800's, the entrepreneur leaving New York to drill for oil in Texas in 1900, or the children of poor blacks who left the South to work in northern factories during the 1940's.

The most recent major population shift also has had the search for financial reward as its principal catalyst and sustainer. But the causes and repercussions of the movement towards the sun—from the "industrial heartland" of the North to the South and West—go beyond economics. Many have moved for reasons that traditional human capital theory does not explain: for "quality of life" reasons. And the growth and development of the sunbelt States has both created and been nurtured by a shift in regional political power.[1] The net result of these factors—economic, sociological, and political—has been a population and employment boom in the South and West, largely at the expense of the North Central and Northeast regions.

This article has two main objectives. The first is to present data from the Current Population Survey (CPS) on industry employment growth by region over the past decade. These data, in conjunction with those from other sources, will be utilized to demonstrate both the change in industrial makeup of the national economy during this period and the regional patterns of industrial growth and decline. The second objective is to briefly examine the factors which have led to the industrial expansion of both the South and West and the relative decline in the North, including those factors which affect the location of business firms, individuals, and families.

Tracking the flows

The CPS is a sample survey conducted monthly by the Bureau of the Census for the Bureau of Labor Statistics, consisting of approximately 56,000[2] households nationwide. In 1978, these households represented 614 areas in 1,113 counties and independent cities, with coverage in all 50 States and the District of Columbia. One advantage of using CPS data is that coverage is not restricted to certain industries or types of employees. Labor force data are collected for all persons age 16 and over, and each employed person is counted only once—in the principal job. The CPS data are adjusted to take account of birth, death, and migration estimates each year and are benchmarked to census data.

The years chosen for this analysis, 1968 and 1978, were at or near the peak of their respective business cycles. These years were selected in order to reduce, as much as possible, the effect of cyclical fluctuations on industry employment patterns, as well as to emphasize a relatively short period of time. Also, 1968 closely corresponds to the start of net immigration to the South.

Industry employment. Trends in industry employment for the Nation as a whole have been fairly well documented. Table 1 shows the proportion of total employment attributable to each major industry group in 1968 and 1978. Not unexpectedly, the big losers were agriculture, where almost half a million jobs were lost, and manufacturing, which added only 700,000 during a period when employment grew by almost 20 million. Indus-

---

Philip L. Rones is an economist in the Office of Current Employment Analysis, Bureau of Labor Statistics.

Table 1. Distribution of employment by major industry, 1968 and 1978 annual averages

Employment	1968	1978
Total (in thousands)	75,926	84,373
Percent	100.0	100.0
Agriculture	5.0	3.5
Nonagricultural wage and salary	87.6	89.3
Private household	2.5	1.4
Government	15.3	16.2
Other private	69.8	71.6
Mining	.7	.9
Construction	4.4	4.6
Manufacturing	26.8	22.3
Durable goods	15.8	13.0
Nondurable goods	11.0	9.0
Transportation and public utilities	5.6	5.4
Trade	16.1	18.2
Wholesale	3.1	3.6
Retail	13.0	14.6
Finance, insurance, and real estate	4.3	5.2
Services	11.9	15.1
Self-employed	6.7	6.7

tries with the fastest rates of growth were all outside of the goods-producing sector. Services experienced by far the most impressive rate of growth—from 12 percent of total employment to 15 percent. Medical and hospital services led the performance of this industry group, almost doubling its proportion of total employment. Other service industries also posted very strong gains, most notably "other" professional, business and repair, and entertainment and recreational services. Wholesale and retail trade, finance, insurance and real estate, and government all posted relative employment gains, with the last concentrated in State and local jurisdictions.

Regional movements. Table 2 shows the states that make up the four major census regions and their divisions. All regions experienced absolute employment gains over the decade. But, as shown in table 3, the Northeast region experienced a large decline in its share of total employment, from 25 to 22 percent, reflecting relative reductions in virtually all of the major industry groups. The North Central region also experienced relative job losses; the South and West posted strong gains in overall employment as well as in most industries.

In the two regions where the employment share fell, the largest loss occurred in areas most dependent on manufacturing—the Middle Atlantic and the East North Central divisions. (See table 4.) Employment in New England, which is only about a fourth of the Northeast total, also declined relative to the rest of the Nation, but at a much slower rate than in the Middle Atlantic area; the less densely populated West North Central division showed a relative rise in employment.

The West exhibited a similar pattern, as the sparsely populated Mountain States had employment gains almost twice those of the Pacific States. In the South, the big gainer was the West South Central division, which includes Texas, Oklahoma, Arkansas, and Louisiana.

Thus, when interpreting data for the four major regions, it should be recognized that the experience of some subregions (divisions) was often much better or much worse than regional totals indicated. Despite this limitation, regional totals are used because they provide a more statistically reliable measure of significant industry employment trends.

Growth factors. Regional employment growth for each industry can be divided into several components. One approach sometimes used in regional analysis is the shift and share technique, which evaluates regional growth based on three factors—national share, industry mix, and regional share.[3] National share indicates an industry's expected regional growth based on its national growth rate. The industry mix component shows the amount of regional employment growth attributable to an above or below average proportion of fast growth industries. Regional share indicates whether an industry in a particular region is growing at a faster or slower rate than the industry nationwide, thus indicating some comparative regional advantage or disadvantage in that industry. The industry mix and regional share components can reinforce each other, when a region benefits from both a positive industry mix—higher than average representation of fast-growing industries—and faster than average industry growth. However, these factors

can also counteract each other, such as when a region has a growing share of an industry with a below average growth rate. Discussion of interregional employment changes in this article involves primarily the regional share component—that is, the effects of a competitive advantage of one region over another.

CPS data can be used to examine regional shifts in the major industry groups. Manufacturing may be the best industry to examine, not because its regional shifts were the most dramatic (indeed, growth rates of several other industry groups in the South and West were more so), but because manufacturing is most often associated with the shift in economic growth from the North to the South.

Nationwide, manufacturing employment grew by less than 700,000 from 1968 to 1978. To put that number in perspective, had manufacturing employment grown at the same rate as all other private, nonagricultural wage and salary employment during that period, the gain would have been almost 5 million. Although factory employment increased in the South and West by more than 900,000 and 300,000, respectively, it declined in the Northeast by almost 800,000. A gain of 200,000 in the North Central region reflected growth in the historically less industrialized States west of the Mississippi River.

One important difference among the four regions is the nature of manufacturing employment. The West, for example, had twice as many workers in durable goods as it had in nondurable goods industries; durables also had a 70-percent employment edge in the North Central region. The South, conversely, had slightly more workers in nondurable goods industries.

Table 4. Total employment by census region and division, annual averages 1968 and 1978

Region	1968 employment	1978 employment	Percent change
Total	75,976	94,373	24.3
Northeast:	8,943	20,961	10.7
New England	4,802	5,589	16.4
Middle Atlantic	14,141	15,372	8.7
North Central:	21,926	26,044	18.8
East North Central	15,750	18,175	15.4
West North Central	6,176	7,869	27.4
South:	22,547	29,892	32.6
South Atlantic	11,349	14,942	31.7
East South Central	4,581	5,671	23.8
West South Central	6,616	9,278	40.2
West:	12,510	17,476	39.7
Mountain	2,789	4,403	57.9
Pacific	9,721	13,073	34.5

Employment Structure. Factory employment in the South has been dominated by low-wage, relatively labor intensive industries. Data from the BLS establishment survey indicate that although 34 percent of factory employment in the South in 1978 was in industries with hourly earnings below the national average for all production or nonsupervisory workers on nonfarm payrolls ($5.69), only 21 percent of the factory workers in the rest of the Nation were in these industries.[4] Correspondingly, 51 percent of manufacturing employees nationwide were in industries with average wages above $6.50 an hour, but only 32 percent of those in the South were so employed. In durable goods, the South had the smallest percentage of industry employment in those industries which have the highest average hourly wage—primary metals, transportation equipment, machinery, and fabricated metals. Those durable goods industries with high employment concentrations in the South—lumber and furniture, for example—are relatively low-paying industries. (However, the South was well represented in several high-paying nondurable goods industries—the chemical industry and relatively small petroleum industries.)

Table 3. Distribution of industry employment by region, 1968 and 1978 annual averages
[In percent]

Employment	Northeast		North Central		South		West	
	1968	1978	1968	1978	1968	1978	1968	1978
Total	24.9	22.2	28.9	27.6	29.7	31.7	16.5	18.5
Agriculture	7.7	8.6	38.7	37.2	36.9	34.8	15.6	19.4
Nonagricultural wage and salary	26.2	22.7	28.5	27.2	29.0	31.6	16.3	18.5
Private household	16.5	18.0	23.6	25.1	44.1	40.0	15.7	16.9
Government	23.0	21.6	24.2	25.0	32.8	34.2	20.1	19.7
Other private	27.2	23.4	29.6	28.2	27.7	30.6	15.5	17.8
Mining	12.6	10.1	16.7	15.3	51.6	56.6	19.1	18.0
Construction	22.1	16.1	26.8	25.3	35.3	38.7	15.8	20.0
Manufacturing	29.8	25.1	32.4	32.3	25.1	28.8	12.7	13.8
Durable goods	28.7	25.3	37.4	36.6	19.2	22.8	14.7	15.3
Nondurable goods	31.3	24.8	25.2	26.1	33.6	37.5	9.8	11.6
Transportation and public utilities	26.1	23.3	28.4	25.6	28.5	31.8	17.0	19.3
Trade	24.0	21.2	29.2	28.1	29.5	31.2	17.3	19.5
Wholesale	24.3	21.0	28.3	28.3	30.3	32.2	17.1	18.5
Retail	23.9	21.2	29.5	28.1	29.3	31.0	17.3	19.7
Finance, insurance, and real estate	31.0	26.4	25.5	24.0	25.9	29.6	17.5	20.6
Services	27.7	25.5	27.4	26.2	27.1	28.9	17.8	19.4
Self-employed	22.5	19.6	26.2	24.3	32.2	33.3	19.1	22.8

More than two-fifths of all nondurables employment in the South was in two industries—textiles and apparel—compared with only about 1 in 8 in those industries in the rest of the country. Textiles and apparel are traditionally low-paying industries; the combined average wage in 1978 was only slightly more than $4 an hour, compared with more that $5.70 for all other nondurables.

Climates for growth

Response of firms. The movement of firms from the industrial North to the sunbelt has been less important to regional employment growth than widely thought. Several studies have shown that, in the South, creation of new firms and expansion of existing firms tend to be the dominant causes of employment growth.[5] In the North, the closure of existing firms tends to be of primary importance.

Certainly many factors are considered in the decision to start, expand, or to relocate a firm in a particular region. In 1975, the Fantus Company, a locational consulting firm, assessed the business climate of the 48 contiguous States on the basis of 15 criteria. States with low taxes, low levels of public assistance, restrictive labor legislation, and a low level of government debt had low scores indicating more favorable environments.[6] The firm's lists of 12 "best" and "worst" States are provided below, along with a numerical score:

The Best	*Score*	*The Worst*	*Score*
Texas	192	New York	628
Alabama	210	California	581
Virginia	214	Massachusetts	547
South Dakota	230	Michigan	532
South Carolina	236	Delaware	520
North Carolina	239.5	Connecticut	516.5
Florida	244	Pennsylvania	506
Arkansas	248	Minnesota	505.5
Indiana	251	Oregon	499
Utah	279	Washington	495
North Dakota	286	Vermont	489
Mississippi	287	New Jersey	483

To test the Fantus criteria as a measure of business climate, Weinstein and Firestine compared the Fantus rankings with the change in manufacturing employment from 1970 to 1977.[7] This comparison supported the State rankings, with some exceptions. For instance, Indiana experienced a factory job decline despite a high ranking, and California and Oregon experienced strong gains despite allegedly unfavorable business climates.

The inclusion of the corporate tax components in the Fantus study is interesting. Although State and local governments use tax incentives as their primary inducement to attract industry, researchers have almost unanimously found corporate tax programs to have no significant impact on industrial location. Weinstein and Firestine, for instance, conclude that Southern States probably pay (in lost tax revenues) for relocations that would have occurred anyway.[8] Of much greater importance than special tax benefits are the supply and productivity of labor, proximity to markets, wage levels, and access to raw materials or transportation.[9] It should be kept in mind that these factors were not included in the Fantus study.

The Federal role. The allocation of Federal funds has been one of the most important factors contributing to economic development in both the South and West. Most notably, defense spending patterns over the last several decades have intensified the shift of both population and manufacturing out of the Northeast and North Central regions and into the South and West.[10] This can be seen most dramatically from data on military prime contract awards. From 1951 to 1976, the South increased its share of these awards from 11 to 25 percent of the national total; the West's increase was just as dramatic, from 16 to 31 percent. Allowing for population shifts, the percentage change in prime military contracts per capita for each region was as follows: Northeast (−29.5), North Central (−45.8), South (109.0), and West (32.1).[11]

These data reflect, to a large extent, changing defense requirements. Aerospace and other high technology industries have developed largely in California and in several areas of the South. The growing dependence on high technology industries for defense needs has led to the channeling of funds to these areas. Similarly, funds for the space program have gone largely to both the South and West: with program headquarters in Houston; the launching station in Cape Canaveral; the rocket center in Huntsville, Alabama; and the research arm in California. Research and development supported by defense and space program funds have led to many technological advances that have become commercially successful. Thus, the areas and firms that benefited from such Federal funds have become the manufacturing centers for products such as computers, calculators, semiconductors, scientific instruments, and many others.

Varied effect on industries. Considerable publicity has been focused on the transfer of manufacturing jobs out of the older industrial areas of the North and into the South and West. But if manufacturing employment were held constant, the relative job growth of the four regions would be affected only slightly. In general, manufacturing has been losing its dominance as an employer. Hence, although its relative demise is a key to the slow growth rate in the Northeast, manufacturing employment can only be seen as a relatively small part of the economic expansion of the South and West.

The activities of the service-producing sector are primarily concerned with local consumption. The rise of the trade and service industries in the South and West for instance, is largely the result of population shifts to these areas; changes in employment in retail trade, as one might expect, closely matches the regional shift in total employment. This relationship is shown in table 3.

Although construction is not a service, it, too, is an industry where demand is largely dependent on population pressures. It is, in fact, the industry that had the greatest relative decline in the Northeast and growth in the West; construction employment shifted less dramatically out of the North Central region and into the South. In both the South and West, expansion of the construction work force has resulted from rapid urban and suburban development, construction of interstate highways, as well as the need for industrial structures that accompanied growth in manufacturing.[12]

The concentration of finance, insurance, and real estate employment also shifted towards the growth regions at a faster rate than did total employment. The Northeast still had the largest concentration of major insurance companies in 1978. However, there was a substantial expansion of financial institutions in the developing areas during 1968–78 (as the demand for these services grew), and real estate, primarily a local activity, grew most where population and employment increased. Transportation and public utilities followed the same pattern. Employment in transportation depends on the need to move people and goods and, hence, responded immediately to the regional shifts in population and business activity; jobholding in public utilities had a similar predictable reaction to commercial and residential growth.

The response of workers

The factors that lead to an individual's decision to move to a new region certainly overlap with those that cause a business to either relocate or to expand in one area instead of another. Lower personal income taxes or good weather, for instance, might influence the decisions of both individuals and businesses to relocate. In fact, the two decisions are partly a function of each other; businesses may move to utilize a growing labor pool, and people may move to take advantage of new business opportunities. However, it may be useful to look at the relative employment growth in the South and West from the individual's (or family's) perspective, separate from the firm's perspective. The following discussion should be viewed as a summary only, borrowing from the extensive literature on interregional migration patterns.

As the rate of increase in total population (the excess of births over deaths) declined in recent years, interregional migration accounted for an increasing share of population change, particularly in the South. In fact, during 1970–75, net migration accounted for about half of the population gain in both the South and West. In the previous 5-year period, migration accounted for only about 12 percent of the population rise in the South; the West, on the other hand, experienced a strong immigration throughout the postwar period.[13] During 1968–78, the four major regions experienced the following net migration:[14] Northeast (–2,384,000); North Central (–2,034,000); South (2,655,000); and West (1,763,000).

The South was a net loser of more than 230,000 persons during the first year (March 1968 to March 1969). By the following year, the region posted a slight net gain and has posted strong migration gains ever since. (These data relate only to persons moving from one region to another. Immigration from other countries, which has been particularly important in the South and West, is not included in this analysis.)

Characteristics of migrants. On average, regional migrants (and migrants in general) tend to be better educated than the nonmigrants at both the place of origin and destination. Several hypotheses have been proposed to explain the relationship between migration and education:[15] persons in professional occupations respond to a geographically broader job market than do those in blue-collar and service occupations; educated persons are better at obtaining and processing job market information and, thus, are better able to deal with economic disequilibria; the effects of distance tend to decline with higher levels of education; and investment in occupation-specific training often precludes occupational mobility as a method of increasing income, making geographic mobility more attractive.

Using CPS data for men over age 25, Larry Long found a strong positive relationship between the level of education and migration rates for all age groups.[16] However, he also observed that migration rates tended to be higher at the lowest education levels (0–7 years) than in the middle levels (8–12 years), although not nearly as high as in those groups that included persons with at least some college. Although Long was reporting on interstate rather than interregional migrants, others have found a similar relationship for interregional migrants. Moreover, higher education appears correlated with a greater average distance of migration.[17]

The propensity of highly educated persons to migrate has most likely aided the fairly recent development of the high technology industries in the South and West. The ability to attract an adequate supply of skilled labor is often cited as the most important factor in the locational decision of a firm.

Age is another determinant of the propensity to move between States or regions. The highest rate of migration occurs at age 23, with rates steadily declining as persons age.[18] (The propensity to migrate appears *not* to increase among the oldest age groups, despite the increased mobility often associated with retirement.) When migration is seen solely as an economic decision, the relationship between age and migration becomes clearer. A younger person has more time to maximize the benefits of migration. The costs of moving (actual moving expenses, loss of seniority or pension coverage, and so on) become more difficult to recoup the older the person becomes. And, certainly, the younger person faces less cost in moving to begin with—he or she is less likely to have a family, accumulated possessions, and, of course, job-related costs. It is not coincidental, then, that the peak migration age corresponds closely to the usual age of graduation from college. The migration of the young, which often follows an investment in human capital, is generally governed by the search for employment and is constrained by the fewest number of costs, both economic and personal.

It is interesting to note that although educational attainment and age have been almost universally cited as critical determinants of migration, Julie DaVanzo, using person and family data from the University of Michigan's Study of Income Dynamics, found no correlation between these factors and migration when other factors (many of which vary with age and education) were held constant.[19] One possible explanation for this result might be that the data set included only persons who were married in both survey years, 1971 and 1972. The author pointed out that typically reported migration tendencies may reflect, in large part, persons who are not yet married.

Economics—the primary factor. Economic factors are the most critical to the migration decision. Certainly the differences in propensity to migrate based on age and education are strongly linked to economic considerations. Long and Kristen Hansen, using results from the 1974, 1975, and 1976 Annual Housing Surveys, found that 59 percent of all interstate migrants cited job-related factors as their major reason for moving, when only their major reason could be reported.[20] These job-related factors included job transfer, new job, looking for work, entering or leaving Armed Forces, and others. Although these results emphasize the importance of employment factors in the decision to move, they also demonstrate, as the authors note, that economic reasons fail to account for the movements of a sizable proportion of the population.[21] Table 5 shows the reasons given by persons moving to and from each of the four major regions. The link between migration for job reasons and net interregional migration (derived from top line) can easily be seen.

Data for the South show the clearest link between economic opportunity and migration during the past decade. One way to view economic development in the South, and, hence, the region's attractiveness to potential migrants, is by looking at changes in per capita income. In 1950, per capita income in the South was only three-fourths the national average. This differential reflected, more than any other factor, the relatively undeveloped nature of the South's economy in 1950, particularly its heavy emphasis on agriculture. In the last 3 decades, increased development resulted in an industry mix that is quite similar to that of the Nation as a whole. As a result, by 1975, per capita income in the South slightly exceeded the national average, although only Delaware, Maryland, and the District of Columbia had per capita incomes above the national average. (But these areas have had economies quite different than what has existed in the rest of the South.) Most Southern States had per capita incomes 50 to 70 percent of the national average in 1950, reaching 80 to 90 percent by 1975.[22] Moreover, regional differences in the cost of living (generally lower in the South) tend to equalize discrepancies in *real* per capita income.

Although regional income data serve as evidence of the narrowing gap in economic opportunity between the South and the Nation as a whole, the individual responds less to average income in a region or State than to specific job-market opportunities. DaVanzo found that families with heads who are looking for work were more likely to move than other families, supporting Long and Hansen's findings that job search factors are a key determinant of migration.[23] Of those looking for work, the unemployed were more likely to move than those who were employed. In fact, unemployment status was found to be the single largest determinant of migration (including interregional migration). Among those who moved, persons looking for work were more

[1] Data represent all three 12-month periods preceding the 1974, 1975, and 1976 Annual Housing Surveys.

likely to move greater distances than those not looking.

DaVanzo also attempted to assess the effects of unemployment rates at the place of origin and at the destination. Families with employed heads were found to be insensitive to the unemployment rate at the place of origin. When the family head was unemployed, then the unemployment rate at the place of origin and at the possible destinations influence the occurrence and destination of a move. Also, high levels of nonwage income tend to induce persons to stay, particularly the unemployed. Persons who migrated and were unable to find acceptable work tend to move again, often returning to their place of origin.

Various methods have been used to attempt to measure the financial returns to migration, including matching the migrants to persons with similar characteristics at the place of origin (if the person's origin wage rate or income is unknown) and at the destination. Greenwood warns, however, that financial returns attributable to migration can easily be overstated.[24] First, migration often involves a change in occupation. Thus, to attribute the increase in earnings to migration itself may be unreasonable. Also, migration frequently follows an investment in human capital; as indicated earlier, migrants tend to be relatively young and well educated. Thus, the measured income or wage differences may be attributable more to the investment in education than to migration. But the importance of financial considerations should not be minimized: three-fifths of migrants identify job factors as their main reason for moving, and some unidentified proportion of the rest are influenced, at least partly, by economic factors.[25]

Noneconomic factors. If almost 60 percent of interstate migrants cited job-related factors as their major reason for moving, then, of course, 2 out of 5 persons moved principally for noneconomic reasons. Note from table 6 that the Northeast was a net loser among family heads who moved because they were attending school, were retiring, wanted to be closer to relatives or for other family-related reasons, and because they wanted a change of climate.

Family considerations appear to be important to a sizable group of interregional migrants. Almost 2 out of 5 women who head households cited family factors as their primary reason for moving. Also, of interstate movers age 55 and over, one-third cited family reasons; 15 percent or less of the younger groups did so. Those moving for family reasons (whether females or males) were often return migrants. The South, which had a net outmigration until the late 1960's, most likely has received the largest share. In fact, it was the only region to have a net inflow of persons who cited family factors as their main reason for moving.

Climate is also an important noneconomic factor in the migration decision. Table 6 shows the results from a national sample survey conducted in 1973–74 by David Morgan and the National Opinion Research Center at the University of Chicago. These indicate that a much higher proportion of persons in the Northeast and North Central areas wanted to change their area of residence than those in the West and South.[26] And, as previously shown in table 5, the South and West have been net gainers among persons who move primarily because of a desire to change climate. Interestingly, in absolute numbers, more young persons (age 20–34) move for reasons of climate than do those age 55 and older.

Table 6. Proportion of persons desiring to live elsewhere with interregional migrants excluded, by census areas

Area	Percent indicating desire to live elsewhere
Middle Atlantic	30.8
East North Central	30.2
West North Central	29.2
New England	20.9
East South Central	17.1
West South Central	17.1
South Atlantic	14.0
Mountain	13.0
Pacific	12.8

NOTE: Data include all those wishing to live in another State.

SOURCE: David J. Morgan, *Patterns of Population Distribution: A Residential Preference Model and Its Dynamics.* (Chicago, University of Chicago, Department of Geography, 1976, p. 22.)

Long and Hansen propose that people are becoming increasingly able to assign a high priority to environmental quality in deciding where they live.[27] Some of the causal factors include smaller families and more single-person households and households comprising unrelated persons (large families and the presence of school-age children tend to impede migration).[28] Also, in some cases, wives who work outside the home—whose numbers are growing rapidly—may give their husbands greater flexibility to choose their place of residence according to criteria other than maximization of his income (although, certainly, a wife's career may impede other families from moving).

Summarizing the factors that influence the migration decision, it has been shown that:

1. Age and education (or, at least, factors associated with age and education) are critical determinants of the propensity to migrate;
2. The individual's employment status is of primary importance, and the job market conditions at the place of origin and at the destination may serve to "push" or "pull" persons, particularly the unemployed, into migrating;
3. The decision to migrate is a family decision, dependent on the current and potential income of both wife and husband; and
4. Individuals and families have become increasingly able to base their migration decisions on noneconomic factors—particularly, the search for a better living environment (of which climate is only a part).

Increasing economic opportunity in the sunbelt States, coupled with the perception that many of these areas can provide a better quality of life has resulted in a somewhat dramatic migration of both people and jobs from the North (particularly the most industrialized areas) to the South and West. BLS data document rapid employment growth among a broad range of industries in the sunbelt States during 1968–78, reflecting the diversity of both the firms and jobseekers attracted to these areas, as well as the variety of resources and other natural advantages that contribute to economic growth.

Changing patterns: altered policies

Regional growth and decline occur not only because of changes in comparative advantage between regions but also as a result of public policy, of which defense expenditures, mentioned earlier, are a primary example. Much of the regional impact of Federal policy, for example, results from programs and policies that are largely unrelated to regional development. Defense policies probably did more for recent economic growth in the West than did any other factor. Science and research policies also have resulted in providing economic advantage to selected regions. Federal welfare policy, energy policy, transportation and water resources policy, and virtually all Federal programs have definite regional impacts.

Thus, the migration of population and employment is much more than a demographic curiosity. With recent migration have come changes in the locus of both economic and political power, and a shift of concern from the future of the South to that of the North. The problem of urban decline in the northern industrial areas in the 1970's is just as compelling an issue as were the problems of poverty and economic backwardness in the rural South which have been a national concern throughout much of this century. To address adequately the regional imbalances in growth and development, policymakers must understand not only the economic, but also the personal or sociological factors that have resulted in this imbalance. ☐

Identifying States and areas prone to high and low unemployment

An analysis of employment and unemployment changes during the 1974–75 recession confirms that States and areas with heavy concentrations of manufacturing employment were more likely to have higher jobless rates; construction employment was also a factor

RICHARD ROSEN

Analysis of unemployment trends in specific States and metropolitan areas over the last business cycle confirms the generally acknowledged fact that the goods-producing sector—especially manufacturing and construction—are more adversely affected during a recession than the service-producing sector. Northeast and North Central industrial areas were hardest hit by the 1974–75 recession. Vacation and resort areas were also adversely affected by the economic slowdown, not only because of the decrease in construction activities, but because of changes in consumers' spending on discretionary items such as leisure. Smaller more agricultural States in the Western North Central region were affected to a much lesser extent, as were the Western States.

Researchers and analysts are debating whether the Nation is headed toward or is already in a recession. Their discussions focus on the movements of various key economic indicators, including the unemployment rate. While it is not possible to forecast which parts of the country would be hardest hit by an economic slowdown, a look at changes in unemployment rates during the last recession provides some insight about which States or areas could be affected most by rising unemployment.

This article examines monthly over-the-year changes in the unemployment rates of the 50 States from the first half of 1974 to the first half of 1975—the period with the largest increase in unemployment nationally in the last recession. It also looks at unemployment rates in some 200 metropolitan areas, representing about two-thirds of the Nation's labor force. Because the rates are not seasonally adjusted, over-the-year comparisons, which minimize the effect of seasonal fluctuations, are used.

National employment-unemployment changes

In the 1973–75 recession, the national unemployment rate peaked during the first half of 1975—averaging about 8.9 percent. From the first half of 1974 to the first half of 1975, it increased more than 3.5 percentage points, and total payroll employment declined by about 1.7 million. Virtually all the decrease in employment occurred in the goods-producing industries—primarily manufacturing and construction. The number of jobs in construction was lower by 610,000, and manufacturing employment dropped by more than 2 million. In contrast, the service-producing industries had a net gain of more than 850,000 jobs, as decreases in transportation, public utilities, and wholesale trade were more than offset by continued growth in retail trade, the finance, insurance, and real estate group, services, and in government.

Sharp declines in manufacturing employment have characterized almost all postwar recessions. Declines in construction also have occurred during most of the earlier slowdowns but generally were not as large as in 1974–75. The high interest rate structure which prevailed in the last recession was primarily responsible for this unusually sharp decline.[1] The 1974–75 downturn was the most severe in terms of employment losses since 1948, except for the 1957–58 decline. Although the 1957–58 drop in manufacturing was not as great as in the 1974–75 recession, service sector employment declined by 78,000 during 1958 while incresing by 874,000 in 1975. As a result, the net total employment loss was larger in the earlier recession than in 1974–75.

Total annual average payroll employment has declined 5 times in the postwar period—1949, 1954, 1958,

---

Richard Rosen is an economist in the Office of Employment Structure and Trends, Bureau of Labor Statistics.

1961, and 1975. An employment drop in durable goods manufacturing preceded the 1949 overall slowdown; reductions in nondurable goods occurred prior to the 1958 and 1975 recessions; and a drop in construction employment preceded the 1954, 1958, 1961, and 1975 recessions. Service employment growth has generally slowed during years when overall employment declined, but has declined only nce during the 1948–78 period. Employment in the mining industry displayed a downward trend from 1948 to 1971 until the energy crisis of the 1970's spurred a turnabout.

The impact of the recession is, of course, felt differently across the Nation. Because of the large role of manufacturing in previous recessions, areas with a relatively large share of manufacturing employment are more likely to experience higher unemployment rates than areas with relatively large service economies. Areas with substantial construction employment—often rapidly growing areas—may also experience more severe economic downturns. However, because construction employment generally accounts for less than 7.5 percent of State or area employment, major declines are necessary to substantially affect total employment. In contrast, manufacturing employment accounts for more than one-fourth of total employment in a majority of the States. During the 1974–75 recession, employment declines in manufacturing, along with construction in some areas, were major factors in the economic downturn, and States and areas with relatively large proportions of employment in manufacturing generally experienced the largest increases in unemployment rates.

Table 1. Characteristics of States prone to high and low unemployment, 1974–75

State	Average over-the-year change in unemployment rate, January–June 1974 to January–June 1975	Average unemployment rate, January–June 1975	Percent of 1974 nonagricultural employment in—	
			Construction	Manufacturing
United States	3.7	8.9	5.1	25.7
High unemployment-prone States:				
Arizona	5.7	12.1	7.8	15.1
Arkansas	5.7	10.6	5.8	31.8
Florida	5.6	10.7	9.6	13.1

Nebraska	1.6	4.2	5.3	18.6
Nevada	2.9	10.4	6.1	4.8
New Mexico	2.6	10.7	7.2	8.2
New York	3.0	9.1	3.7	22.2
North Dakota	−0.4	4.3	6.6	7.8
Oklahoma	2.7	6.8	5.6	17.7
Oregon	3.6	11.3	4.7	23.5
South Dakota	1.3	4.2	5.4	10.1
Texas	1.7	5.6	6.9	19.1
Utah	1.8	6.8	5.6	16.2
Vermont	2.9	9.7	5.3	26.3
Virginia	3.2	7.1	7.4	22.3
Washington	1.8	9.5	4.8	21.2
West Virginia	2.4	6.1	5.5	23.1
Wisconsin	2.9	7.8	3.8	32.1
Wyoming	1.2	4.9	10.3	6.2

'Unemployment-prone' States

The national unemployment rate increased by an average of 3.7 percentage points from the first half of 1974 to the first half of 1975. The following changes in the unadjusted unemployment rates occurred during this period:

	Unemployment rate		*Percentage point change*
	1974	1975	
January	5.6	9.0	+3.4
February	5.7	9.1	+3.4
March	5.3	9.1	+3.8
April	4.8	8.6	+3.8
May	4.6	8.3	+3.7
June	5.8	9.1	+3.3

States with increases above the national average may be classified as "cyclically high unemployment prone" and States with increases below the national average can be classified as "cyclically low unemployment prone."[2] (See table 1.)

Only 17 States had above-average over-the-year unemployment rate increases, including 6 of the 10 largest States with over 5 million inhabitants—Florida, Massachusetts, Michigan, New Jersey, Ohio, and Pennsylvania. However, the two largest States—California and New York—had increases of 3.1 and 3.0 percentage points, somewhat below the national change. The primary reason so few States had above-average increases is that the changes are clustered in the largest States, which have the heaviest weight in the national average. In contrast, 15 States had increases of less than 2.0 percentage points, and only six States had increases of 5.5

percentage points or more. Of the 15 States with relatively small increases, eight had fewer than 1 million inhabitants; Texas was the only large State.

States where unemployment rose most sharply were concentrated in Northeastern and North Central industrial areas and in the South; Arizona was the only Western State with a substantial rise in unemployment. Fifteen of the 17 States with above-average rate increases also had an above-average proportion of jobs in manufacturing, compared with only 6 of the 34 States with below-average rate increases.

The proportion of total employment in the construction industry in each State varied much less than the share in manufacturing—between 3.8 and 10.3 percent, compared with 2.8 to 38.6 percent in manufacturing. In only seven States (Alaska, Louisiana, Wyoming, Arizona, Florida, North Carolina, and Hawaii) was construction more than 7.5 percent of total employment. Changes in construction activity in these States was a major factor in determining whether it was a high or low unemployment-prone State during the 1974–75 period.

High levels of construction activity aided the economies of Alaska, Louisiana, and Wyoming, bolstered by increased activities related to energy-construction of the oil pipeline in Alaska, mining in Wyoming, and oil and gas extraction in Louisiana. Major declines in construction employment adversely affected Arizona, Florida, and North Carolina. Construction in Arizona and Florida was primarily for vacation and retirement residences, activity especially sensitive to cyclical fluctuations and money market conditions. The first three States were classified as "low unemployment prone" during the period, while the latter three were classified as "high unemployment prone." Hawaii had a relatively modest drop in construction (6 percent) and was classified as low unemployment prone.

. . . and metropolitan areas

Although State unemployment rates may be useful in identifying broad regions of the Nation which are af-

[1] Data are for 1975.

[2] Data not available.

NOTE: Data for metropolitan areas in four States—Illinois, Wisconsin, West Virginia, and New Hampshire—are not available.

fected by rising unemployment, a look at changes in unemployment at the area level can pinpoint, more directly, places where unemployment is most severe. Almost all metropolitan areas had over-the-year increases in unemployment during the first half of 1975; fewer than 5 percent experienced declines. (See table 2.) Data for metropolitan areas in four States, Illinois, Wisconsin, West Virginia and New Hampshire, are not available.[3]

About 1 of every 3 metropolitan areas for which data are available had over-the-year increases in their unemployment rate in excess of the national increase during the first half of 1975. Areas with the largest increases (5.0 percentage points or more) included the 11 metropolitan areas in Michigan, where auto production predominates; older industrial areas such as Lowell, Fall River, and New Bedford, Massachusetts, Providence, Rhode Island, York and the Northeast Pennsylvania area—where the recession may have accelerated an already declining economy—and resort and retirement areas such as Ft. Lauderdale, Miami, Orlando, and West Palm Beach, Florida, and Phoenix, Arizona.

The majority of the areas with large increases in unemployment had a heavy concentration of manufacturing employment. In many instances, employment declines occurred primarily in durable goods manufacturing industries such as motor vehicles, primary metals, and fabricated metals. These industries predominate in North Central metropolitan areas. In other cyclically high unemployment-prone areas, nondurable goods manufacturing suffered most, particularly textiles and apparel. This was the primary cause of higher unemployment in metropolitan areas of North Carolina and Pennsylvania and in Providence, Rhode Island.

Although many resort areas in Florida were severely affected by the recession, actual declines in service-related employment were slight. However, most of these areas had experienced large employment gains in service industries in the years prior to the recession, so that the relatively modest changes indicate a significant break in trend. Much greater declines occurred in construction employment, as many of these areas had experienced construction booms resulting from the purchases of retirement and vacation residences. Phoenix was also in this category. Declines in manufacturing, particularly in durable goods, also were a contributing factor in employment losses in both Miami and Orlando.

Forty-nine metropolitan areas had unemployment rate increases of 2.0 percentage points or less from the first half of 1974 to the first half of 1975—a relatively modest increase compared with the national average. (See table 3.) These cyclically low unemployment-prone areas were scattered among 21 States. All of the metropolitan areas in Washington and Louisiana were relatively less affected by the recession, as were 10 of the 12 areas in Texas. Virginia had three such areas, and Connecticut, California, Alabama, South Carolina, Nebraska, Kansas, and Montana had two areas each.[4]

These less unemployment-prone areas had a relatively low proportion of employment in manufacturing. Only 7 of the 49 areas had more than one-fourth of employment in manufacturing in 1974, the national average proportion. (In contrast, almost three-fourths of the high unemployment-prone areas had manufacturing employment above the national average.)

Changes during 1979

Compared with the first 6 months of 1978, the national unadjusted unemployment rate declined by 0.5

Table 3. Characteristics of metropolitan areas prone to low unemployment, 1974–75

Area	Change in unemployment rate, January–June 1974 to January–June 1975	Average unemployment rate, January–June 1975	Percent of 1974 nonagricultural employment in—	
			Construction	Manufacturing
Alexandria, La.	1.8	10.2	6.7	14.0

Saginaw, Mich.	1.2	High	(2)
Salem, Oreg.	0.8	Low	Durable, construction
Savannah, Ga.	0.2	Medium	Durable, construction, services
Sioux City, Iowa	1.3	Medium	Durable, construction, wholesale and retail trade
Sioux Falls, S.D.	0.3	Low	Wholesale and retail trade
South Bend, Ind.	0.1	Medium	No declines
Spokane, Wash.	0.7	Low	Construction
Toledo, Ohio	0.6	High	No declines
Topeka, Kans.	0.4	Low	No declines
Trenton, N.J.	0.2	High	Nondurable, durable
Williamsport, Pa.	0.5	High	No declines

[1] High denotes rate change in excess of the national increase (3.7 percentage points); medium denotes rate change between 2.1 and 3.7 points; low denotes a change of 2.0 points or less.

[2] Data not available since March 1979.

[3] Data are not available separately for durable and nondurable goods.

percentage points, from a 6.4- to 5.9-percent average for the first half of 1979. However, during this period, 50 metropolitan areas had over-the-year increases in unemployment rates. (See table 4.) More than one-half of these were cyclically high unemployment-prone areas during the last recession, while only about one-seventh were cyclically low unemployment-prone areas.

Nearly all of the areas experienced over-the-year employment declines in one or more industry sectors.[5] Reductions were about evenly divided between construction, durable goods, and nondurable goods.

The most prominent declines were in the industrial metropolitan areas of Michigan, Indiana, and Ohio, generally high unemployment-prone areas in the 1974–75 recession. Four areas in Pennsylvania and three in New Jersey also experienced increases in unemployment in 1979. These also were high unemployment-prone areas during 1974–75.

Areas less prone to increases in unemployment during the 1974–75 period but whose rate increased in 1979 include Birmingham and Mobile, Alabama; Boise City, Idaho; Salem, Oregon; Sioux Falls, South Dakota; Spokane, Washington; and Topeka, Kansas. In most of these areas, employment declined in nondurable goods and, in a few instances, in durable goods manufacturing; Salem also experienced construction declines.

Thus, changes in construction and manufacturing employment continue to influence the economies of many States and metropolitan areas. As the concentration of employment shifts geographically, States and areas which gain employment in cyclically-sensitive industries may increase their incidence of unemployment, while States and areas with broadening service economies may decrease their incidence of cyclical unemployment. ☐

FOOTNOTES

[1] The average yield of new FHA mortgages rose from 8.62 percent in the second half of 1973 to 8.92 percent in the first 6 months of 1974 and to 9.82 percent in the second half of 1974, before easing to 9.04 percent during the first half of 1975. *Economic Report of the President, 1976*, p. 239.

[2] Percentage point changes are used in this analysis because they are believed to be most comparable to the national average. If the percent change in the rate of unemployment were used, one State (Massachusetts) would be shifted from the high to low recession-prone category, and four States (Colorado, Illinois, Iowa, and Kentucky), would be shifted from the low to high recession-prone category.

[3] Nationally, the unemployment rate increased 2.9 percentage points on an annual basis from 1974 to 1975. The increase in Illinois was the same as the national increase; while the rise in New Hampshire was above average (3.6 percentage points), but the increases were below average in Wisconsin (2.4 percentage points) and in West Virginia (1.6 percentage points). It is, therefore, likely that many of the eight large metropolitan areas in Illinois, Manchester, New Hampshire, and some of the seven areas in Wisconsin experienced above-average increases in the rate of unemployment.

[4] The Washington, D.C. metropolitan area, which includes the Northern Virginia suburbs, also had a relatively small increase in unemployment.

[5] Industry employment data are not available for Michigan metropolitan areas since March 1979. However, the rise in unemployment rates in most of the Michigan area is clearly automobile-related.

Folding paperboard box industry shows slow rise in productivity

More efficient equipment and production techniques contributed to an increase in output per hour and a decline in work hours in 1963–78; the advance was smaller than for manufacturing as a whole

JAMES D. YORK

Productivity in the folding paperboard boxes industry has risen at nearly the same rate as for manufacturing generally. A major contributor was the introduction of more efficient equipment and production methods.

As measured by output per employee-hour, productivity in the industry increased at an average annual rate of 2.0 percent during 1963–78, compared with 2.2 percent for all manufacturing industries.[1] In this period, output rose at an average annual rate of 0.3 percent and employee-hours declined at an average annual rate of 1.7 percent. (See table 1.) Productivity gains have been boosted by advances in printing technology, widespread adoption of power equipment for finishing operations, and faster gluing machinery.

Long-term growth in the industry's productivity has not been steady and declined slightly during 1973–78. From 1963–69, output per employee-hour increased at an average annual rate of 2.1 percent. This period was characterized by rising output, and stable employment and work hours. Output increased at a rate of 2.1 percent while employee-hours showed no overall change. Declines in productivity occurred in 1965 and 1969. The decline of 5.2 percent in 1965 was offset by increased growth during the next two years. The productivity decline of 2.8 percent in 1969 was the result of a 6.2-percent increase in output, outpaced by a 9.3-percent increase in employee-hours. The largest increase in productivity occurred in 1967, when output fell 0.9 percent, but employee-hours fell 9.5 percent. The resulting increase in productivity was 9.5 percent. During 1969–76, productivity increased at a rate of 3.5 percent. The period was characterized by a slight dip in output and a rapid decline in hours. Output decreased at an average annual rate of 0.4 percent, while hours decreased at a rate of 3.8 percent. Competition from substitute packaging materials adversely affected the industry's market and encouraged efforts to achieve greater efficiency. Improved equipment, such as faster printing presses, permitted the industry's producers to maintain output, while reducing employment and work hours. Productivity increased in five years of this 7-year period. The 1970 decline of 7.2 percent was more than offset by the large gains of 9.2 and 8.4 percent that occurred during the next two years. A 0.4-percent decline occurred in 1975 (a recession year) when output fell 10.9 percent and work hours, 10.6 percent.

In 1977, productivity fell 5.1 percent; employee-hours had increased 6.9 percent but output rose only 1.4 percent. In an effort to work off a backlog of orders from the preceding year, and to ensure meeting customer demand, more employees were added during 1977. Anticipated demand did not materialize, however. Frequent changes in production runs, associated with order backlogs, led to reduced efficiency. In 1978, productivity continued to decline as an increase in employee-hours, 7.7 percent, outpaced the increase in output, 3.9 percent.

James D. York is an economist in the Division of Industry Productivity Studies, Bureau of Labor Statistics.

Industry serves a broad market

Folding paperboard boxes are used to package a variety of consumer products, including beverages, cosmetics, and detergents. Because the range of products is great, the industry's market is strongly influenced by the entire economy, rather than by the sales of only a few products.

Competition from substitute packaging materials, such as plastic, has limited the growth of the markets for various types of folding paperboard boxes, contributing to the lack of long term growth over the 15-year period covered by the study.

The largest use of paperboard boxes is in packaging dry foods.[2] More box tonnage is used for this than for any other item. Dry food's share of the market for paperboard boxes has increased slightly, from 25 percent of tonnage shipped during 1963 to over 27 percent during 1978. Of the various dry foods packaged in paperboard boxes, cereals and pet foods have shown the most growth in recent years.

Beverage carriers and soap containers are two other important uses. Output of beverage carriers increased rapidly during 1963–68. During 1968–72, however, output declined. It began to increase again in 1973, and by 1978 the output of beverage carriers passed the peak reached 10 years earlier. Substitute packaging was probably a factor in the decline of 1968–72, as sales of malt beverages, and bottled and canned soft drinks increased rapidly. Shipments of soap cartons showed no discernible trend over the 1963–78 period.

Changing market conditions have dampened the demand for retail boxes during recent years. Many fast-food chains have introduced substitute packaging materials, such as styrofoam, which have cut into the container market.[3] Available data indicate that shipments of retail boxes (including laundry boxes) increased by 33 percent during 1971–74, after fluctuating somewhat in preceding years. Since 1974, however, shipments have resumed the irregular movements of earlier years.

The production of paperboard box containers for textile and candy products increased during 1963–68, but has been declining since. In contrast, the production of boxes for medicinal products nearly doubled over the 1963–78 period.

Table 1. Productivity and related indexes for the folding paperboard boxes industry, 1963–78

[1967 = 100]

Year	Output per employee-hour			Output	Employee-hours		
	All employees	Production workers	Nonproduction workers		All employees	Production workers	Nonproduction workers

1973–78	–.1	–.1	.1	1.0	1.1	1.2	.9

Employment declines

Total employment in the folding paperboard box industry declined 8.4 percent between 1963 and 1978, an average of 1.5 percent per year. In 1963, there were 51,300 employees, but by 1978 there were only 47,000. Industry employment, however, did not decline steadily. During 1963–69, total employment fluctuated, but there was no downward trend. The two largest movements were a 9.2-percent decrease in 1968 and a 10-percent increase in 1969. During 1969–78 there was a significant downward trend. Employment declined 12.1 percent, equivalent to an average annual rate of 1.8 percent. The two largest decreases occurred in 1970 and 1975, periods of strong cyclical contraction. The 1970 decline was nearly 9 percent, and in 1975, more than 11 percent. Conversely, employment rose in 1972 and 1976 as a result of increased economic activity. Employment continued to grow during 1977 and 1978.

The number of production workers fell more rapidly from 1963–78 than did the number of nonproduction workers. The average annual rate of decline for production workers was 1.6 percent, compared to a rate of 1.1 percent for nonproduction workers. The many technological advances in production equipment appear to have contributed to the more rapid decline in the number of production workers.

Average hourly earnings have risen steadily since 1972, the first year for which such data are available. From 1972 to 1978, average hourly earnings rose 65 percent, from $3.70 to $6.09. In terms of both absolute levels and trends, the average hourly earnings for the period closely paralleled those for all manufacturing.

Improvements in technology

The traditional method of producing folding paperboard boxes consists of several stages. Paperboard, in the form of a roll, is fed to a sheeter which cuts the roll into discrete sheets. These sheets are fed through a press which performs the desired printing. After printing, the paperboard passes to the cutter and creaser, which cuts out the carton blanks and puts creases at points where the carton is to be folded. The cut and creased cartons, which are still held in the paperboard sheets by small connections left by the cutting blades, proceed to the finishing operation. At this stage, the scrap is removed by a process known as stripping. This is the last step in producing many types of folding cartons, which are then ready for delivery to the user. Other types are glued together before being shipped.

Improvements have been made in all stages of the production process. For longer production runs, many plants now bypass the sheeter altogether and feed the paperboard sheet directly to the printing press, speeding production. This means increased efficiency for long production runs, when setup time is unimportant. In shorter runs, however, setup time is an important consideration because these operations require more frequent changes in the production line. Consequently, sheeters continue to be used for runs of shorter length; their brief setup time requirements more than offset their lack of production speed.

Significant changes have taken place in printing. The offset lithography process has supplanted the older, letterpress process throughout much of the industry. Lithography is based on the principle that oil and water do not mix. Image and non-image areas on lithographic plates are separated by chemical means, rather than by a height differential, as in the letterpress method. In addition, the letterpress plates make direct contact with the paperboard, often requiring an exacting preparation to compensate for height irregularities in the image carriers. Much less preparation is needed for lithographic plates, however, because they lack significant height differentials, and make contact with a resilient rubber blanket rather than the actual paperboard.[4]

Another change in printing is the greater use of presses which apply many colors in a single pass, eliminating the need for multiple passes.

Faster drying inks and ink-drying equipment have become available, eliminating the long production delays associated with older, slower drying inks.[5] Newly developed ultraviolet inks, for example, dry almost instantly when exposed to ultraviolet light, permitting the paperboard to pass quickly to the cutting and creasing process.[6] With conventional inks, the printed paperboard often had to be held for hours or days before being cut and creased.

Some manufacturers are now purchasing inks in premixed form, eliminating the hours otherwise required to mix the inks at the plant.

Part of the problem in maintaining color uniformity in production runs stems from the need to control the thickness of the ink layer, which is applied to the carton. In an effort to insure effective control of the applied ink layer, some manufacturers have adopted computerized color control systems, which enable the ink application specifications for a certain production run to be dialed at a central control console.[7] The ink fountains on the press are then automatically adjusted to apply the ink layer at the proper thickness. By re-entering the same specifications at the console, reprints can be easily produced. This system greatly reduces the amount of adjustment work required to control the thickness of the ink.

After printing, the paperboard is cut and creased. Platen cutters are now available which perform this operation faster than cylinder cutters. Afterward, the scrap must be removed from the cartons. Platen cutters remove some and reduce the amount of finishing required. Some new platen cutters can remove all of the scrap on certain jobs, eliminating the need for a separate finishing operation. Power hammers have greatly improved the efficiency of the stripping process, when used in separate finishing operations, after cutting and creasing is complete.

Many of these operations can be performed in a continuous process, rather than in separate stages. Gravure presses make such continuous processing possible. Although not economical for short-runs, gravure equipment provides great economies in very large-scale production. The gravure press is web fed, and the entire carton-making process, printing, cutting, creasing, and stripping is carried out in one continuous, on-line operation.

As the length of production runs increases to meet the needs of large customers, many producers have adopted the gravure presses, for greater efficiency. Large runs are required to justify their adoption, however, because of the time and expense involved with the setup work.

After the scrap has been stripped away, many types of cartons are ready for shipment, but others must first pass through a gluing operation. There have been many improvements in glues and gluing equipment. Some new glues dry quicker. Greater drying speed and faster gluing equipment have resulted in speedier production.[8] Mechanical feeders have been adopted which increase the rate at which the glue machines can be fed. Their benefits have been largely confined to long runs, however, due to the setup time they require. The adoption of automatic quality control equipment for use on the gluing line has also contributed to increased production speed. The equipment can inspect cartons and reject the faulty ones much more quickly than can human inspectors.

The final step in the production operation involves putting the finished cartons into containers for shipment. Many producers have adopted automatic machinery for this task, resulting in greater speed and reduced labor time. Once packed in shipping containers, the boxes are transferred to storage or shipping areas. Various types of materials handling equipment have facilitated this task. Automatic conveyor systems can transfer the packed containers to the warehouse in predetermined group sizes for easier palletizing.[9] Fork trucks then handle the palletized containers.

Continued gains likely

Productivity should continue to increase as improved production equipment is adopted by more manufacturers. The trend toward faster printing presses is likely to continue. Ultraviolet ink printing, which eliminates the lag in drying time, can be expected to become more popular as the technology is improved and more producers find it affordable.

Faster equipment for cutting and creasing, and gluing operations has increased productivity and should contribute to future improvements. Further improvements in quality control equipment may speed production. A number of manufacturers with long production runs have found it economical to adopt the more efficient gravure presses, continued adoption of which appears likely and should add to overall efficiency in the industry.

Computer technology will also contribute to future gains in productivity. Computerized control of ink application has already been adopted by some manufacturers and will likely spread. Computers can also be applied to the process of making dies for the cutting and creasing process. New applications for computers should, in time, aid further advances in productivity.[10]

Another operation which may become more efficient in the future is warehousing. The technology for automated warehousing already exists but represents an expensive investment. However, the gains which might be realized could induce producers to use it.

Continued competition from substitute packaging materials should be an incentive for producers to reduce costs, resulting in widespread adoption of the best available technologies, and the development of improved production equipment.

Measurement techniques and limitations

The productivity indexes in this study measure the change over time in industry output per unit of labor input. These indexes do not measure the specific contribution of labor, but reflect the influence of many factors, such as changes in technology, capital investment, capacity utilization, and the skill and effort of the work force.

The preferred output index for manufacturing industries would be obtained from data on quantities of the various goods produced by the industry, each weighted (multiplied) by the employee-hours required to produce one unit of each good in some specified base period. Thus, those goods which require more labor time to produce would be given more importance in the index.

The annual output index for the folding paperboard box industry is based on quantity data published by the Paperboard Packaging Council in the annual issues of the *Marketing Guide.* Because unit labor weights are not available at the detailed product level, substitute unit value weights, assumed to be proportional to unit employee-hour weights, have been used to combine the products. The annual output indexes have been adjusted to levels based on data reported in the *Census of Manufacturers.* The most current adjustments presented in this study reflect data from the 1972 economic census.

Employment and employee-hour indexes were derived from data published by the Bureau of the Census. Employees and employee-hours are each considered homogeneous and additive, and thus, do not reflect changes in the qualitative aspects of labor, such as skill and experience. A technical note describing the methods used to develop the indexes is available from the Division of Industry Productivity Studies, Bureau of Labor Statistics. ☐

FOOTNOTES

[1] The folding paperboard box industry is composed of establishments primarily engaged in manufacturing folding paperboard boxes from purchased paperboard. It is designated as industry 2651 in the 1972 Standard Industrial Classification (SIC) Manual. All average annual rates of change are based on the linear least squares trend of the logarithms of the index numbers. Extension of the indexes will appear in the annual BLS Bulletin, *Productivity Indexes for Selected Industries.*

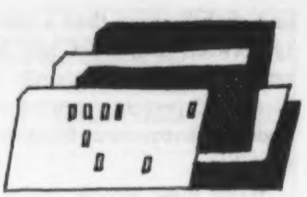
Research Summaries



Conflicts between work and family life

JOSEPH H. PLECK, GRAHAM L. STAINES, AND LINDA LANG

How prevalent is the conflict between work and family life in the general population of workers? What forms does it take? What working conditions exacerbate it? For the first time, the Quality of Employment Survey, conducted for the U.S. Department of Labor by the Survey Research Center at the University of Michigan, provides some data on the extent to which work interferes with family life.[1]

The survey results suggest that a substantial minority of workers living in families experienced conflict between work and family life. These conflicts most often concerned excessive work time, schedules, and fatigue and irritability caused by work. Parents reported more conflict than other couples, but, surprisingly, women did not report more conflict than men although the kinds of conflicts reported by the two sexes differed. Specific working conditions, such as excessive hours at work, scheduling, and physically or psychologically demanding work were associated with experiencing work-family conflict, which, in turn, was related to diminished job satisfaction, and contentment with life in general.

Prevalence and types of interferences

Workers in the survey[2] who were currently married or living with a child under 18 were asked: "How much do your job and your family life interfere with each other—a lot, somewhat, not too much, or not at all?" Table 1 shows the responses of various groups of workers. More than 10 percent of the entire sample said that work-family conflict occurred "a lot" (severe conflict) and another quarter indicated that it occurred "somewhat" (moderate conflict). Altogether, more than a third of all workers living in families experienced either moderate or severe work-family conflicts.

As expected, parents experienced conflict significantly more often than other workers. Being a parent increased the incidence of moderate or severe conflict by about 7 percentage points among husbands in two-earner families, 14 points among breadwinning husbands, and 13 percent among wives of employed husbands. Working parents of preschool children also reported more conflict than did parents of school-age children.

However, several expected differences were not confirmed by the data: the employment status of the spouse was unrelated to work-family conflict and employed women did not, on average, report work-family conflict significantly more often than did employed men. Among all employed women (including wives and those heading single-parent families), about 35 percent reported moderate or severe conflict, compared with 34 percent for employed husbands. The margin was somewhat greater if employed wives were compared with employed husbands—37 versus 34 percent—but still was not significant. Employed women who headed one-parent families actually reported work-family conflict somewhat less often than did men.

Thus, work-family conflict is evident among a substantial minority of workers. It appears heightened among parents, compared with other couples; but not among women, compared with men. Employed women and men experienced work-family conflicts to a similar degree. It is possible that these data underestimate sex differences. For example, employed women may be less willing than men to acknowledge conflicts, because they feel others will use these conflicts as evidence that they should not be working. Also, employed women with severe work-family conflict may have more freedom than employed men to leave the labor force. Nonetheless, the data suggest that working men encounter work-family conflicts to an extent more similar to women than is usually thought.

Workers who reported "somewhat" or "a lot" of interference between their work and family life were asked how these roles interfered with each other. The three most common responses were "excessive work time," "schedule conflicts," and "fatigue and irritability."[3] The frequencies of these conflicts are shown in table 2. Half the sample with moderate or severe interference reported excessive time spent at work as a specific problem,

and slightly more than a quarter reported incompatibility between their work and family schedules (sometimes resulting from other family members' work schedules). Nearly 15 percent reported negative physical or psychological consequences from work, such as fatigue and irritability.

When these specific types of work-family interference problems were examined, sex differences became evident. Employed men were significantly more likely than women to report excessive work time as a problem, while employed women were more likely than men to report schedule incompatibilities and fatigue and irritability (resulting from their work) as impinging on their family life.

Thus, while men and women reported to the same degree all forms of work-family conflict combined, they experienced this conflict in different ways. Men more often reported excessive work time, at least in part because they worked more hours than women. Women more often reported schedule conflicts, presumably because women more often have to see that family responsibilities are met and have to arrange their work schedule accordingly. Women's greater family responsibilities may also be the reason for their more frequent reports that physical and psychological consequences of work caused family problems. Fatigue and irritability brought home from work may make it more difficult for a woman to perform her family tasks, and thus, may cause a problem for her family. These same feelings may not have this effect for the husband because he generally has fewer home tasks to perform.

Contributing job characteristics

What job characteristics seem to cause work-family conflict? Other information in the survey makes it possible to analyze several working conditions as potential sources of these conflicts. The specific job characteristics[4] are shown in table 3.

Table 1. Frequency of work-family conflict

[In percent]

Group	Not at all	Not too much	Somewhat	A lot
Total sample	24.3	41.3	24.0	10.4
Employed husbands	25.9	40.4	23.6	10.1
Wife employed	26.7	41.8	21.0	10.5
No children	35.1	37.1	20.3	7.4
Youngest 0–5 years	22.9	41.3	22.9	12.8
Youngest 6–17 years	20.0	46.8	20.7	12.3
Wife not employed	25.0	38.7	26.6	9.7
No children	35.0	38.7	20.0	6.3
Youngest 0–5 years	20.4	32.8	37.1	9.7
Youngest 6–17 years	20.3	45.6	20.8	13.3
Employed wives	22.5	40.5	26.5	10.5
Husband employed	22.9	39.1	27.7	10.4
No children	37.1	33.7	18.5	10.7
Youngest 0–5 years	11.8	40.3	36.1	11.8
Youngest 6–17 years	16.3	43.5	31.0	9.2
Husband not employed	18.8	55.8	14.0	11.6
Employed women in one-parent families	17.0	58.0	13.6	11.4
Youngest 0–5 years	18.6	55.8	9.3	16.3
Youngest 6–17 years	15.6	60.0	17.8	6.7

NOTE: The total sample size is 1,084; percentages are based on weighted sample.

Table 2. Frequency of common types of work-family conflicts

[In percent]

Group	Excessive work time	Schedule incompatibility	Fatigue and irritability
Total sample	50.0	28.0	14.8
Employed husbands	59.1	20.4	8.8
Wife employed	62.8	22.4	10.9
No children	52.8	31.4	15.1
Youngest 0–5 years	65.8	42.1	10.5
Youngest 6–17 years	69.2	12.3	7.7
Wife not employed	55.8	18.6	7.0
No children	57.5	22.5	5.0
Youngest 0–5 years	53.1	19.8	7.4
Youngest 6–17 years	58.8	13.7	7.8
Employed wives, husband employed	38.7	38.7	27.4
No children	36.4	31.8	43.2
Youngest 0–5 years	26.4	41.5	26.4
Youngest 6–17 years	49.3	40.8	18.3
Employed female single parents	10.0	50.0	15.0

NOTE: The total sample size is 372; percentages are based on weighted sample among those experiencing moderate or severe conflict.

The characteristics most strongly and significantly associated with all work-family conflict were number of hours worked; frequent overtime; the work schedule, particularly the afternoon shift; and physically or psychologically demanding work. Having to work with an irregular starting time, having low control over whether one works overtime, and having little flexibility to change one's work schedule or take time off from work for personal or family matters were also significantly associated with work-family conflict, though to a lesser degree. This pattern of correlates of work-family conflict is intuitively plausible. Interestingly, being self-employed, holding a second job, and time spent or problems experienced in commuting to work were unrelated to conflict.

The three types of work-family conflict also had an expected pattern of correlates. Reporting that excessive work time interfered with one's job and family life was related to excessive hours spent working, as well as to the frequency of overtime and number of hours worked. Schedule incompatibilities between work and family demands were uniquely related to afternoon, evening, and irregular work shifts. Reporting that fatigue and irritability generated at work interfered with family life was associated with describing one's work as physically or psychologically demanding.

The analysis of specific types of conflict reveals certain unexpected correlates as well. The various job characteristics concerning overtime were not associated with reporting schedule conflicts between work and family, although they were associated with perceiving excessive time at work as causing problems for the family. It may be that workers subject to overtime, particularly men, perceive its effects on their families less in terms of disrupting their families' schedules and more in terms of simply taking time away from their families.

Holding a job which makes high physical or mental demands was associated not only with perceiving work-generated fatigue and irritability as causing problems for the family, but also with reports of excessive time spent at work. In these workers' descriptions of their work-family problems, it may be that the boundary between saying that their job makes them tired and that they work too much is a subtle one: having a demanding job can produce either.

Surprisingly, inability to alter one's schedule or to take time off was unrelated to workers' reporting schedule conflicts between work and family life, though it is related to the two other conflicts. Other evidence indicated that the majority of workers in the survey felt their work schedule suited them.[5] Having a schedule that cannot be easily changed caused problems only if the schedule was unsuitable to begin with. When such a schedule did cause problems for the family, workers perceived these problems as their working too much or their job leaving them too tired, rather than in terms of conflicts with the schedules of other family members.

Correlation with overall satisfaction

When work-family conflict occurs, does it have any consequences? One kind of evidence on this point concerns the relationship between reports of conflict and measures of workers' satisfaction with their jobs and family life, and their satisfaction with life in general. Table 3 shows the correlation coefficients between these measures[6] and work-family conflict. Workers who said their job and family lives interfered with each other reported significantly lower satisfaction with both their jobs and their family life. They also reported significantly lower contentment with life in general.

The three specific types of work-family conflict had the same correlates, with one important exception: perceiving one's work time as excessive and interfering with family life was not associated with diminished family satisfaction. To reduce workers' satisfaction with their family life, time at work has to do more than simply take the worker away from the family; it has to conflict with others' schedules or leave the worker tired.

MINIMIZING CONFLICTS between work and family life can be only one of many goals in the design of work schedules. Just as working conditions which may be desirable for employers or workers may reduce family well-being, working conditions that reduce work-family conflicts may be costly in other ways. The survey results do not suggest that working conditions be changed in any particular way to benefit the family; rather, they show that the scheduling and demands of work do affect workers' lives, and imply that these effects should be examined, together with other factors, when policies about working conditions are considered. ☐

Table 3. Correlation coefficients between work-family conflicts and job characteristics and satisfaction

Job characteristics and satisfaction	Work-family conflicts			
	All conflicts	Excessive work time	Schedule conflict	Fatigue and irritability
Job characteristics:				
Main job hours[1]	[2]0.24	[2]0.27	−0.02	0.01
Total job hours[1]	[2].25	[2].30	−.02	.03
Day shift[3]	[2]−.19	[4]−.07	[2]−.21	.03
Afternoon shift[5]	[2].13	.02	[2].22	−.01
Night shift[6]	.05	.00	[2].09	−.02
Irregular shift	[4].07	.01	[2].11	.03

Self-employed	.00	−.04	−.04	[4]−.08
Second job	.01	.07	.01	.02
Commuting time	−.04	−.05	−.02	−.02
Commuting problems	.05	.00	.00	.06
Satisfaction:				
Job satisfaction	[2]−.19	[11]−.08	[11]−.09	[2]−.11
Family satisfaction	[2]−.15	−.02	[2]−.10	[11]−.08
Life satisfaction	[2]−.18	[2]−.10	[2]−.10	[11]−.09

[1] Per week.

[2] Significant at 0.001.

[3] Jobs with regular starting times between 3:30 and 11:59 a.m. (90 percent of which had starting times between 6 and 10 a.m.).

[4] Significant at 0.05.

[5] Jobs with starting times between noon and 5:59 p.m.

[6] Jobs with starting times between 6 p.m. and 1:30 a.m.

[7] Overtime frequency was classified by workers as occurring "never," "sometimes but less than weekly," or "weekly or more often," and assigned values of 1, 2, and 3.

[8] Low overtime control was assessed by an index of items concerning whether the worker or employer decided whether the worker put in overtime hours, and whether the worker could refuse overtime without penalty.

[9] The schedule inflexibility index is constructed from items concerning difficulty in changing work days, in changing work hours, and in taking time off from work for personal or family matters.

[10] The work demands index was based on the physical effort required by one's job; whether the job required one to work fast, and whether the job required one to work hard.

[11] Significant at 0.01.

NOTE: The sample size varies from 942 to 1084. Correlations are Pearson's *r* or point-biserial correlations.

FOOTNOTES

[1] This report is condensed from one submitted to the Assistant Secretary of Labor for Policy, Evaluation, and Research under contract No. J-9-M-7-0119. For a general summary of the survey's results, see Graham L. Staines and Robert P. Quinn, "American workers evaluate the quality of their jobs," *Monthly Labor Review*, January 1979, pp. 3–12.

[2] Information on the sample drawn for this survey appears in Robert P. Quinn and Graham L. Staines, *The 1977 Quality of Employment Survey* (Ann Arbor, Mich., Survey Research Center, 1978), Ch. 2.

[3] The other 4 general categories were time (not further specified); schedule uncertainty; work travel; and vacation-related problems. The category "time" was reported by 14 percent of workers with moderate or severe conflict; the other categories were evident in fewer than 5 percent each.

[4] Further details are in Joseph H. Pleck, Graham L. Staines, and Linda Lang, *Work and Family Life: First Reports on Work-Family Interference and Workers' Formal Childcare Arrangements, from the 1977 Quality of Employment Survey* (Wellesley, Mass., Wellesley College Center for Research on Women, 1978).

[7] Quinn and Staines, *The 1977 Quality of Employment Survey*, pp. 82–86.

[8] Job satisfaction is based on items concerning satisfaction with both general and specific features of one's job. The family satisfaction index is based on items concerning how happy one's marriage is, how satisfied individuals are with their marriage, and how satisfied they are with their family life. Life satisfaction is based on the items "Taking all things together, how would you say things are these days? Would you say you're very happy, pretty happy, or not too happy these days?" "In general, how satisfying do you find the ways you're spending your time these days? Would you call it completely satisfying, pretty satisfying, or not very satisfying?" and 8 other items assessing specific feelings or words that can characterize a person's life (for example, full versus empty, and hopeful versus discouraging). Details on job and life satisfaction are in Robert P. Quinn and Linda J. Shepard, *The 1972–73 Quality of Employment Survey* (Ann Arbor, Mich., Survey Research Center, 1974), pp. 47–69. For family satisfaction, see Pleck, Staines, and Lang, *Work and Family Life*, pp. 15–16.

Age Discrimination in Employment Act: a review of recent changes

JULIA E. STONE

As originally enacted, Title VII of the Civil Rights Act of 1964 required the Secretary of Labor to conduct a study of age discrimination in employment. The study led, 3 years later, to enactment of the Age Discrimination in Employment Act of 1967 (ADEA) to prohibit employment discrimination against persons age 40 to 65. These age limits were chosen to focus coverage on workers especially likely to experience job discrimination because of their age. The "upper age limit" was set at 65 because it was a common retirement age in U.S. industry. In 1978, the act was amended to extend protection beyond age 65—without any upper age limit in the Federal sector and until age 70 for most other workers in the United States.

The law prohibits discrimination on the basis of age in such matters as hiring, job retention, compensation and other terms, conditions, and privileges of employment. Employers, employment agencies, and labor organizations are covered by the act.[1] They are prohibited from using employment-related advertisements that indicate any preference, limitation, specification, or discrimination based on age. Employment agencies and labor organizations may not use age as a basis for classifying or referring persons for employment.

There are certain exceptions to the application of the act's prohibitions. An employer may discharge or otherwise discipline an individual for good cause. The law's prohibitions also do not apply where age is a bona fide occupational qualification reasonably necessary to the normal operation of a particular business, or where differentiation is based on reasonable factors other than age. Also, employers are allowed to make some age distinctions in providing fringe benefits to facilitate the employment of older workers.

Mandatory retirement age

The major issue addressed by the Age Discrimination in Employment Act Amendments of 1978 was mandatory retirement. Data from a 1973 Employment Practices Survey conducted by the Bureau of Labor Statistics indicated that approximately half of the private nonagricultural work force was subject to mandatory retirement provisions.[2] Most of the provisions set the mandatory retirement age at 65, some used a higher age, and a very few stipulated a lower age.

In the Congressional deliberations which led to enactment of the 1978 ADEA amendments,[3] the following themes were advanced in support of action to restrict mandatory retirement. Individual ability to perform a job, rather than arbitrary age distinctions, should be the basis for continued employment. Public opinion, as evidenced in a 1974 Harris survey, is opposed to forced retirement based on age. As Americans experience greater longevity and the number of older persons grows, those who are capable of working beyond age 65 should be permitted to do so. Because of widespread retirement before age 65, a relatively small portion of the work force has actually been forced to retire between age 65 and 70; and the availability of fully accrued pension and social security benefits at age 65 should continue to facilitate voluntary retirement at age 65. Medical evidence has indicated that mandatory retirement can have a detrimental effect on a person's physical, emotional, and psychological health, and even on his or her life span. Following retirement, many people experience financial difficulties because of various factors. These include considerable decreases in income which often accompany retirement, difficulty in finding reemployment, longer life spans over which to stretch savings, erosion of fixed pensions by inflation, and—especially for women who have entered the labor force after raising a family or being widowed or divorced—restricted accrual of eligibility for significant retirement benefits as a result of mandatory retirement. It was also suggested that forced retirement of capable older workers results in unnecessary demands on governmental programs, such as the social security system and various assistance programs at State and local levels, as well as the Federal level.

Concerns regarding possible adverse effects of eliminating mandatory retirement were also discussed during the legislative process. Three major areas of concern were identified: (1) the possibility of an adverse impact on employment opportunities for young people and on promotional opportunities for midlevel employees—including minorities and women; (2) uncertainty regard-

---

Julia E. Stone is a labor economist in the Division of Legislative Analysis, Employment Standards Administration.

ing workers' productivity beyond age 65 and potential administrative burdens in evaluating employees' performance; and (3) possible implications for pension arrangements.

New coverage and limited exemptions

Rather than entirely remove the act's upper age limit, Congress agreed to extend age discrimination protection without an upper age limit for almost all Federal employment (effective September 30, 1978) and until age 70 for most private and nonfederal public employment (effective January 1, 1979).

The extension of coverage to age 70 for private sector and State and local government employment was accomplished by raising the law's upper age limit from 65 to 70. Also, new language was added to Section 4(f)(2) of the law to clearly prevent mandatory retirement of covered workers under employee benefit plans such as retirement, pension, or insurance plans.[4] On April 6, 1978, this protection against mandatory retirement took effect for employees under age 65. On January 1, 1979, it took effect for workers up to age 70—along with the new age-70 limit on coverage. However, for workers employed under collective bargaining agreements, the protection against mandatory retirement under Section 4(f)(2) was phased in and became generally applicable on January 1, 1980. Mandatory retirement at ages 65 through 69 was also allowed to continue for tenured faculty in institutions of higher education until July 1, 1982, and indefinitely for certain high-level executives and policymakers.

The deferred application of the newly stated restriction of mandatory retirement under employee benefit plans affected employees working under collective bargaining agreements in effect on September 1, 1977. Mandatory retirement of such employees at ages 65 through 69 was allowed to continue until termination of their agreement or January 1, 1980, whichever came first.[5] The delay was provided to give maximum deference to collective bargaining agreements negotiated between labor and management, because the contracts had been negotiated in good faith with reciprocal agreements and concessions made on various issues, including mandatory retirement. This avoided undue disturbances in labor-management relations while pension plan agreements were clarified. A provision in the Equal Pay Act of 1963, allowing a similar delay where there were collective bargaining agreements in effect, was cited as a precedent for this temporary exemption.

The 1978 amendments also included an exemption allowing mandatory retirement of tenured employees in institutions of higher education at ages 65 through 69 until July 1, 1982,[6] in response to concern regarding declining enrollments and faculty reductions resulting from demographic trends. Advocates of the exemption asserted that the prohibition against mandatory retirement until age 70 could result in the faculty reductions having a disproportionate impact on recently hired, untenured faculty—particularly women and minorities. There was also some concern that current financial difficulties of colleges and universities could be exacerbated by requiring retention of highly paid senior faculty beyond age 65 without allowing for budgetary planning. In addition, concern was expressed that the nature of tenure agreements, designed to protect the academic freedom of faculty, would be compromised without the exemption.

The exemption allowing the mandatory retirement of high-level executives and policymakers at ages 65 through 69 applies only when the individual has been employed in "a bona fide executive or a high policymaking position" for the 2 years prior to mandatory retirement *and* is entitled to an immediate nonforfeitable annual retirement benefit provided by the employer equivalent to a straight-life annuity of at least $27,000.[7] This amount excludes retirement benefits attributable to contributions of prior employers or to employee contributions. It also excludes retirement income from social security. The definition of "bona fide executive" set forth in regulations under the Fair Labor Standards Act[8] should be met for an individual to come within the scope of the exemption as an executive. Employees in high policymaking positions were placed in the exemption to encompass high-level personnel whose positions and responsibilities give them a significant role in the development and implementation of corporate policies though they may have little or no line authority.[9] The reasons cited for this exemption were the need to assure promotional opportunities—especially for midlevel employees and for achieving affirmative action goals—and the difficulty involved in evaluating the performance of top executive personnel.

Federal workers

In extending age discrimination protection for Federal workers, coordination of the 1978 amendments with provisions under various other statutes governing employment in the Federal sector was a significant concern. Thus, effective September 30, 1978, along with providing for application of the ADEA to Federal employment without any upper age limit, the 1978 amendments also repealed a statutory civil service provision that required the mandatory retirement of Federal workers when they reached age 70 and had 15 years of Federal service. A prohibition against Federal hiring of workers age 70 or older on a permanent basis was also repealed. The amendments did not repeal mandatory retirement provisions applicable to Federal employees in certain specific occupations—air traffic controllers, law enforcement officers, firefighters, employees of the Alaska Railroad, the

Panama Canal Company, the Canal Zone Government, the Foreign Service, and the Central Intelligence Agency.[10] However, Congressional committees which have jurisdiction over such employment in the Federal Government agreed to review the remaining mandatory retirement provisions to determine if they should be continued

The 1978 amendments also clearly specified that the Federal sector is only subject to the age-40 coverage limit and the provisions contained in Section 15 of the Age Discrimination in Employment Act. Section 15 was added to the act in 1974 to extend coverage to Federal employment. The 1978 language makes clear, for example, that the Federal sector coverage is not affected by the exemptions allowing continued mandatory retirement of certain employees under collective bargaining agreements, in institutions of higher education, or in executive and high-level policymaking positions.

Procedural amendments

Two amendments modified the procedural requirements involved in private individuals' lawsuits and governmental enforcement of the act. These amendments were a response to concern about frequent dismissal of lawsuits by the courts on procedural grounds, without consideration of the substance of the age discrimination complaints involved. A third procedural amendment concerned the right of aggrieved individuals to a jury trial. All three went into effect on April 6, 1978.

Filing of charges. Before going to court with a private lawsuit, an individual who believes that he or she has suffered discrimination in violation of the ADEA is required to notify the Federal enforcement agency[11] of the alleged violation within 180 days of its occurrence (or within 300 days if the alleged violation occurs in a State which has an agency empowered to grant or seek relief from age discrimination).[12] The notification required by the 1978 amendments is in the form of a "charge alleging unlawful discrimination." This charge may be filed in the form of a written statement which identifies the potential defendant and describes the action believed to be discriminatory. This replaced a requirement that a "notification of intent to sue" be filed within the 180- (or 300-) day period.[13] The new language parallels the 180-day charge language under Title VII of the 1964 Civil Rights Act.

In many instances, age discrimination is not discovered by the victim until some time after the alleged unlawful practice has occurred. In some instances, a potential plaintiff may take time to attempt to resolve an issue directly with the employer or may take time to obtain an informed legal opinion as to the likelihood of a successful lawsuit. In the past, courts that interpreted the "notice of intent to sue" as a jurisdictional requirement observed the 180- or 300-day time limits rigidly. Congressional conferees on the 1978 amendments explained that the "charge" requirement should not be construed as a jurisdictional prerequisite to judicial consideration, and therefore, equitable modification would be possible. Thus, if a court concludes that a plaintiff had a legitimate excuse for failing to give notice within the 180- or 300-day period, the lawsuit need not be dismissed.[14]

Tolling the statute of limitations. Before instituting court action to enforce the act, the Federal enforcement agency is required to attempt to eliminate alleged discriminatory practices and gain voluntary compliance through "informal methods of conciliation, conference, and persuasion." The 1978 amendments provide that the statute of limitations—2 years for nonwillful violations and 3 years for willful violations—may be tolled for up to a year while informal conciliation is being attempted under this provision.

The purpose of providing for tolling of the statute of limitations during the conciliation process was to assure that, especially in large and complex cases, the enforcement agency should not be forced to go to court simply to protect the right to action without having first had adequate time to complete the conciliation process. This amendment was also designed to prevent those who may have violated the law from delaying or postponing the conciliation process with the possibility of avoiding backpay liabilities because of the statute of limitations. The rationale for placing a time limitation on the tolling provision was to avoid placing an inequitable burden of potential liabilities on employers through prolonged conciliation during which claimants' rights would also go unsatisfied. As indicated during the legislative process, an enforcement agency need not complete conciliation prior to going to court; the courts may stay lawsuits pending before them to permit completion of the conciliation process.

Right to a jury trial. The 1978 amendments clearly provide that the option of a jury trial is available to individuals in cases where there are factual issues regarding alleged discrimination involving potential monetary liabilities, such as backpay.[15] As indicated during legislative consideration of this amendment, the liquidated damages remedy available under the act is in the nature of legal, rather than punitive relief, and is therefore within the scope of the provision.

Study requirements

The 1978 amendments required that the effects of the new coverage provisions be studied. A Department of Labor study of involuntary retirement must include an examination of the effects of raising the upper age limit to 70 and a determination as to the feasibility of further extending or eliminating the age-70 limit on coverage for private sector and nonfederal public employment. The report must also examine the effects of the exemptions allowing age 65 through 69 mandatory retirement of tenured teaching personnel in institutions of higher education and of certain executives and high-level policymakers. A final report is required by January 1, 1982, preceded by an interim report by January 1, 1981.[16]

A report on the effects in the Federal sector by the Office of Personnel Management was required by January 1, 1980.

Administration of the act

In 1979, the Equal Employment Opportunity Commission assumed administrative responsibility for enforcement of the Age Discrimination in Employment Act. On January 1, 1979, this commission took charge of Federal sector enforcement activities for which the Civil Service Commission had been responsible; on July 1, 1979, it assumed ADEA enforcement responsibilities for private sector and State and local government employment, previously carried out by the Department of Labor.[17] Thus, the Equal Employment Opportunity Commission has become generally responsible for enforcing antidiscrimination protection for older workers covered under this law, as well as the protection, under Title VII of the 1964 Civil Rights Act, against discrimination in employment on the basis of race, color, religion, national origin, and sex.

The transfer of ADEA enforcement responsibility to the Equal Employment Opportunity Commission and the important changes made in the act by the 1978 amendments mark an important juncture in the evolution of the Nation's efforts to deal with discrimination in employment as it affects older workers. The experience of workers, employers, and others affected by the 1978 amendments, the required studies of the impact of the new amendments, EEOC experience in enforcing the law, and continuing public attention to the employment needs of older Americans can be expected to contribute valuable information and insights as to whether further modifications of the law may be appropriate in the future. ☐

FOOTNOTES

[1] The ADEA applies to private employers of 20 or more persons, to State and local government agencies, to public and private employment agencies servicing such employers, and to labor organizations if they have 25 or more members or represent the employees of covered employers or refer persons to covered employers for employment.

[2] The Employer Policies and Practices Survey was conducted in September of 1973 by the Bureau of Labor Statistics for the Employment Standards Administration of the Department of Labor. Results of this survey were reported in: Department of Labor, Employment Standards Administration, *Age Discrimination in Employment Act of 1967, A Report Covering Activities Under the Act During 1976*, Submitted to Congress in 1977 in Accordance with Section 13 of the Act, pp. 72–73 and pp. 34–37.

[3] House of Representatives Report No. 95–527, July 25, 1977; Senate Report No. 95–493, Oct. 12, 1977; House of Representatives Report No. 95–950, *Conference Report*, Mar. 14, 1978; and *Congressional Record*, September 13 and 23, and October 19, 1977, and Mar. 21 and 23, 1978.

[4] The 4(f)(2) exception, as amended in 1978, stipulates that while it is not unlawful for an employer, employment agency, or labor organization

> "to observe the terms of a bona fide seniority system or any bona fide employee benefit plan such as a retirement, pension or insurance plan, . . . no such seniority system or employee benefit plan shall require or permit the involuntary retirement of any individual [within the Act's age group coverage] because of the age of such individual."

The clarification of the 4(f)(2) provision in effect overruled the Supreme Court's decision in *United Air Lines, Inc. v. McMann*, 434 U.S. 192 (1977), which permitted application of a mandatory retirement requirement (before age 65) in observance of the terms of an employee benefit plan that predated the original enactment of the law. For a discussion of the case, see *Monthly Labor Review*, February 1978, p. 57.

[5] As the extended grace period does not apply to mandatory retirement under nonunion employee benefit plans, mandatory retirement of employees at ages 65 through 69 under nonunion pension plans has been prohibited under section 4(f)(2) of the ADEA since Jan. 1, 1979, when the age 70 upper age limit on coverage took effect.

[6] The language of the exemption, contained in Section 12(d) of the act, is as follows:

> "Nothing in this Act shall be construed to prohibit compulsory retirement of any employee who has attained 65 years of age but not 70 years of age, and who is serving under a contract of unlimited tenure (or similar arrangement providing for unlimited tenure) at an institution of higher education . . ."

[7] The language of the exemption, contained in Section 12(c) of the Act, is as follows:

> "Nothing in this Act shall be construed to prohibit compulsory retirement of any employee who has attained 65 years of age but not 70 years of age, and who, for the 2-year period immediately before retirement, is employed in a bona fide executive or a high policymaking position, if such employee is entitled to an immediate nonforfeitable annual retirement benefit from a pension, profitsharing, savings, or deferred compensation plan, or any combination of such plans, of the employer of such employee, which equals, in the aggregate, at least $27,000.
>
> "In applying the retirement benefit test, . . . if any such retirement benefit is in a form other than a straight-life annuity (with no ancillary benefits), or if employees contribute to any such plan or make rollover contributions, such benefit shall be adjusted in accordance with regulations prescribed by the Secretary, after consultation with the Secretary of the Treasury, so that the benefit is the equivalent of a straight-life annuity (with no ancillary benefits) under a plan to which employees do not contribute and under which no rollover contributions are made."

[8] See 29 Code of Federal Regulations, Part 541, Section 541.1.

[9] A detailed discussion of the intended scope of the exemption is contained in House of Representatives Report No. 95–950, *Conference Report*, Mar. 14, 1978, pp. 9–10.

[10] Maximum age requirements for entry into Federal employment in certain occupations—for law enforcement officers, firefighters and traffic controllers—were also left unchanged. It should be noted, as well, that under section 15(b) of the ADEA, reasonable exemptions may be established in the Federal sector where it is determined that age is a bona fide occupational qualification necessary to performance of a job.

[11] The U.S. Department of Labor was the agency responsible for enforcement activities under the ADEA until July 1, 1979, when, under

Reorganization Plan No. 1 of 1978, this authority was transferred to the U.S. Equal Employment Opportunity Commission.

[12] In *Oscar Meyer & Co. v. Evans*, 99 S. Ct. 2066 (May 21, 1979), the Supreme Court ruled that workers who seek relief from alleged discrimination under the ADEA must first resort to available State remedies before bringing suit in Federal court. See *Monthly Labor Review*, Sept. 1979, p. 59.

[13] A parallel requirement applicable to Federal employment was not modified by the 1978 amendments to the ADEA and continues to require filing of a notice of intent to sue within the 180-day period.

[14] A 2-year—or in the case of a willful violation, a 3-year—statute of limitations on the recovery of back wages continues to be applicable under section 7(e)(1) of the ADEA.

[15] In *Lorillard v. Pons*, 434 U.S. 575 (1978), the Supreme Court ruled that a jury trial was available under the original language of the ADEA, based on its similarity to the Fair Labor Standards Act, which permits jury trials. See *Monthly Labor Review*, April 1978, p. 51.

[16] Section 5 of the ADEA, as enacted in 1967, stipulated—without a time limit—that: "The Secretary of Labor is directed to undertake an appropriate study of institutional and other arrangements giving rise to involuntary retirement, and report his findings and any appropriate legislative recommendations to the President and to the Congress."

[17] Under Reorganization Plan No. 1 of 1978, which authorized these transfers, the Department continues to be responsible for research (including studying the effects of the 1978 amendments) and for educational and informational activities relating to the expansion of the employment opportunities for older persons.

New occupational rates of labor force separation

DIXIE SOMMERS AND CARIN COHEN

The Bureau of Labor Statistics has recently revised its estimates of labor force separation rates by occupation. These rates represent the net annual rates at which people withdraw from the labor force to retire or because of disability, family responsibility, or death. They, therefore, account for a significant proportion of total job openings in specific occupations.

Because data that differentiate separation rates for specific occupations and States are not available, the Bureau develops proxy rates by applying national age- and sex-specific separation data to the age and sex distribution of employment in specific occupations for the Nation and by State. The newly revised estimates are for 1970, 1980, and 1985. They update those published by the Bureau in 1974.[1]

Table 1 displays the new occupational rates. In almost every occupation, the new 1970 rates are lower than the earlier estimates. Changes in the 1985 rates vary, however, depending on whether more men or more women are expected to be in an occupation. The predominantly male occupations show rate increases, while the predominantly female occupations show declines.

The new occupational rates reflect changes in the age- and sex-specific rates upon which the Bureau bases its occupational estimates. The new 1970 age-specific separation rates for men differ slightly from the previous estimates, reflecting more comprehensive 1970 mortality and labor force participation data. The new 1985 male rates show similar change at ages less than 55 years but increase markedly at 55 years and over because of the significant downward shift in labor force participation. Rates for all but older women, however, *decreased* markedly from earlier rates, reflecting the declining likelihood of female labor force separation because of children and a decline in female mortality rates between 1960 and 1970. Separation rates for older women were higher than the previous estimates, as generally higher labor force participation for younger women has resulted in more labor force separation among women approaching retirement age.

Projecting job availability

Separation rates are used primarily to estimate the number of job openings expected as a result of workers leaving the labor force. Of course, these replacement needs are only one source of future job openings in an occupation; other sources include growth in employment and the need to replace workers who transfer to other occupations or who move to other areas.

State separation rates by occupation are used in the Bureau's State and area projections activities which are part of its Occupational Employment Statistics (OES) program. The State and area projections effort provides information on current and projected employment by industry and occupation, projected job openings resulting from employment growth, and projected openings resulting from labor force separations. This information is developed for States and labor market areas using methods and data from the two other parts of the OES program: the National/State Industry-Occupation Matrix system and the Occupational Employment Statistics survey. State employment security agencies use these data to develop State and area occupational employment estimates and projections.

Current and projected occupational employment and estimates of future job openings are used at the national, State, and local levels for a variety of activities. Projections are used in vocational guidance and employment counseling. Current occupational employment data are used in job development activities and for analysis of current labor market conditions. Current employment and projections are also used extensively, particularly at the State and local levels, in planning occupational training activities, including vocational education programs and training programs sponsored under the Comprehensive Employment and Training Act.

Dixie Sommers is an economist, formerly in the Division of Occupational Outlook, Bureau of Labor Statistics. Carin Cohen is an economist in the division.

Table 1. Estimated and projected national labor force separation rates, by occupation, 1970, 1980, and 1985

[Separations per 1,000 persons]

Occupation	1970	1980	1985

Farm laborers, unpaid family workers	28.2	35.7	36.4
Farm laborers, self-employed	31.3	42.8	44.3

Rate construction

The national age- and sex-specific data the Bureau uses to derive its labor force separation estimates are from the "working life" tables it constructs for the total U.S. population. The working life table is an actuarial device that summarizes the labor force activity and mortality experience of the population. It applies death and labor force participation rates to a hypothetical population for each year of age. Increases in the labor force with population age are interpreted as net labor force accessions, decreases as net labor force separations. Net labor force separations for each year of age are divided by the total population for that age to derive its net separation rate.

BLS constructs working life tables for each of several population groups known to have differing labor force participation patterns: all men and four marital and family-status groups for women (never married, married with no children, married and in the labor force after birth of last child, and divorced, widowed, or separated). Comparison of separation rates among marital status groups for women allows estimation of labor force separations resulting from marriage and birth of children.[2]

. . . *and revision.* There are two major data requirements for using the working life table to calculate separation rates—mortality rates and labor force participation rates. Separation rates are, therefore, revised periodically to reflect changes in death and labor force participation patterns. Working life tables are also projected for estimates of future rates of mortality and labor force participation by age and sex.

The revised separation rates now available are based on 1970 mortality rates published by the U.S. Public Health Service[3] and on labor force participation rates from the 1970 Census of Population, replacing the 1960 rates for women and preliminary 1970 rates for men used for earlier estimates. Projected working life tables for 1980 and 1985 are based on the same comprehensive 1970 data on mortality used for the 1970 tables but on projected labor force participation rates by age and sex, developed by the Bureau's Division of Special Labor Force Studies.[4]

Limitations. The working life table has a number of limitations when it is used to develop occupational separation rates. A major drawback is that the method assumes that mortality and labor force participation rates do not vary by occupation for workers of the same age and sex. This is a limitation in calculating labor force separation for occupations having highly educated workers, because labor force attachment generally is stronger for the highly educated than for most workers. In the case of two occupations, physicians and dentists, the Bureau has developed more accurate, alternative rates from data sources other than the working life table.

OCCUPATIONAL SEPARATION RATES are useful in a number of applications in addition to preparing projections of job openings. Researchers may obtain the rates by contacting the Chief, Division of Occupational Outlook, Bureau of Labor Statistics, Washington, D.C. 20212. ☐

FOOTNOTES

Employment and pay trends in the retail trade industry

BARBARA COTTMAN JOB

As the demand for consumer goods and customer convenience has risen, so has employment in retail trade, advancing by 4 million workers between 1968 and 1978. Only service businesses and State and local governments have added a comparable number of workers over the same period. Who are the workers in the retail trade industry, what are their jobs, and under what kinds of hour and pay arrangements do they work?

In 1978, the industry employed 15.6 million persons in a wide range of activities, such as selling clothing, furniture, fuels, food, and automobiles.[1] About one-third of the Gross National Product passes through the retail trade sector.[2] Sales often serve as a bellwether of the Nation's economic well-being. Retail trade provides the major outlet for personal consumption items and is the major provider of new jobs for young people and women. More than three-fifths of the 2.2-million growth in the number of teenage workers between 1968–78 was in retail trade. During the same period, the industry also accounted for nearly one-third of the growth in the number of working young adults age 20–24 years. Of the 11-million overall increase in women's employment, nearly one-fourth was in retail trade. (See table 1.) In 1968, about 27 percent of persons working in the industry were under 25 years of age, but by 1978, nearly 40 percent were under 25. Women increased their share of employment in the industry from about 45 percent in 1968, to 50 percent in 1978.

All of the employment growth in the industry was among wage and salary earners, their numbers increasing by nearly 40 percent during the decade, from 9.9 million to 13.9 million. About half of the growth was among part-time workers. The number of self-employed and unpaid family workers remained essentially unchanged at 1.7 million. Paid hours of wage and salary workers grew by only 26 percent.[3] By 1978, 35 percent of those employed in retail trade worked less than 35 hours per week, up from 29 percent in 1968 (only entertainment and recreation services used a comparable share of part-time workers in 1978). Further, a reduction in the average workweek of full-time employees was only partially offset by increases for part-time workers.[4] Thus, not only were more people in the industry working at part-time jobs, but even many full-time workers were on the job fewer hours. Accordingly, the average workweek in retail trade declined from 37.2 to

Table 1. Total employment and retail trade employment, by age and sex, 1968 and 1978

[Annual averages in thousands]

Age and sex	1968		1978		1968 to 1978 change:		Change in retail trade employment as percent of change in total employment
	Total	Retail trade	Total	Retail trade	Total	Retail trade	
Both sexes, 16 years and over	75,920	11,585	94,373	15,636	18,453	4,051	22.0
16–19 years	5,780	1,841	7,981	3,221	2,201	1,380	62.7
20–24 years	8,762	1,287	13,498	2,772	4,736	1,485	31.4
25 years and over	61,378	8,457	72,894	9,643	11,515	1,186	10.3
Men, 16 years and over	48,114	6,409	55,491	7,772	7,377	1,363	18.5
Women, 16 years and over	27,807	5,176	38,881	7,865	11,074	2,689	24.3

Barbara Cottman Job is an economist formerly with the Office of Current Employment Analysis, Bureau of Labor Statistics.

35.1 hours between 1968 and 1978.

Despite the decline in the average workweek, retail trade establishments have generally extended their hours of operation to include longer evening and Sunday service, through their heavy reliance upon part-time workers and flexible work schedules. One indication of the industry's flexibility in work scheduling is that it is a primary employer of "moonlighters" (multiple jobholders). In May 1978, of the 4.5 million persons working at two or more jobs, about 1 in 6 was in retail trade as a second job.[5] Only agriculture provided a similar share of secondary employment opportunities.

To some degree, the industry has extended both its operating hours and output without corresponding increases in per-employee hours. Labor-saving innovations, such as self service in gas stations, reduced the number of employee hours required per sale. In retail food stores, changes in equipment reduced the time spent in completing sales transactions, and affected the way employees use their time in preparing to serve customers' needs. For example, the introduction of electronic scales and cash registers substantially reduced the customer's checkout time. These machines are often part of computerized inventory control systems, which eliminate much of the manual work associated with ordering, monitoring, and maintaining stocks. Fast defrosting and self-defrosting refrigerators, centralized poultry processing plants and centralized warehouses, conveyor belts and overhead "railway" systems to load and unload in warehouses, and the increased use of prepackaged meat and produce, have all helped reduce on-site employee-hours. Even the installation of special surfaces in meat departments has helped; the new floors require less time and effort to clean up.

In the area of labor-saving management practices, the move to simplify work processes has received a major impetus from the fast-food chains. Their refinement of the steamlined and standardized approach to managing a largely unskilled work force, subject to high turnover, is likely to set the pattern for continued productivity advances in the food service industry for many years to come. The chains will no doubt spur the increased use of off-premise food preparation, standardized (uniform and frozen portions) food products, limited menu choices, shortened food preparation time, self-service, and higher ratios of equipment to workers. All of these developments have tended to hold down the industry's demand for employee-hours. They shift certain work activities, such as food processing and preparation, from retail employees on-site, to employees either in related industries such as food processing, or to goods-producing industries such as small appliance manufacturing. Certain other work activities, such as cleaning tables, have been shifted to the unpaid labor of consumers. Moreover, these developments have not only reduced the demand for labor time in retail trade, but probably have reduced the labor time needed for the final product.[7] Lastly, these innovations have tended to transform the type of work done in the retail trade industry. Some jobs which once required specialized skill or knowledge have been restructured to require little knowledge or training. This trend is widespread throughout retail trade, but especially in the food service industry. An example is fast-food restaurants, with their stocks of simple equipment, standardized menus, and heavy reliance upon self service. These innovations have reduced the need for qualified cooks and chefs, and for knowledgeable trained service personnel such as waiters, waitresses, and stewards. With the widespread introduction of advanced electronic computing machines and the growing standardization of consumer products, even the need for knowledgeable sales clerks, cashiers, and bookkeepers will decline accordingly. Equipment and products are being designed to be operated (or sold) by minimally trained, unskilled persons, of whom high turnover rates are expected.[8]

Turnover and tenure

Frequent turnover is a characteristic feature of employment in retail trade. It seems that the industry relies heavily on intermittent, short-term workers.[9] Only about half of the persons who worked in retail trade during 1977 had year-round experience, either full time or part time. This proportion was among the lowest of all industry groups, and it differed markedly by sex.

About half of the work experience of women in retail trade during 1977 was part time, and little was year round. A comparable proportion of work experience for men was both full time and year-round. To some extent, the variations between men and women in the duration and type of experience reflect occupational differences. Retail employment for women tends to be concentrated in three occupational groups, clerical, service, and sales, which in 1978 accounted for nearly four-fifths of the retail jobs held by women. Men's employment, by contrast, tends to be more varied, encompassing most of the occupational spectrum. (See table 2.) Two of the occupations in which women are concentrated, service and sales, are characterized by very low rates of full-time, year-round employment. For example, only 20 percent of all food service workers and about 30 percent of retail trade sales workers were employed both year-round and full time during 1977. However, even in these two occupations, the proportion of women working year-round, full time tended to be lower than that for men.

Not only do workers in retail trade tend to work less than year-round, they also tend to work for shorter periods for any specific employer. As of January 1978, half of the women in the industry had worked for their current employers for less than 1.5 years, about 1 year less than the median tenure for all women employees. Half of the men had worked less than 2.5 years, about 2 years less than the median tenure for all men employees. The comparatively short tenure for both men and women in retail trade reflects the use of many temporary workers.

Earnings below average

The relative instability of retail trade employment may be associated with the industry's low earnings profile.[10] In May 1978, the median usual weekly earnings of workers in the industry were only 59 percent of those for all wage and salary workers.[11] (See table 3.) This ratio has changed little since 1967, the earliest year for which data are available. About three-fifths of the retail trade workers reported usual weekly earnings of less than $150, while only 30 percent of workers in other industries reported earnings that low.[12] Three-fifths of persons working in other industries were in the $150–400 per week range. Only one-third of wage and salary workers in retail trade reported such earnings.

The differences in earnings between retail trade workers and those in other industries reflect, in part, the industry's greater employment of young, relatively inexperienced persons and heavy reliance on part-time workers, occupational structure, and extent of unionization.[13] In 1978, about 1 in 5 retail trade workers was under 20 years of age. In all other industries combined, less than 1 in 20 was in that age group. Because young workers generally earn less regardless of industry, the concentration of the young in retail trade tends to result in lower than average wages. Although the industry employs many part-time workers, even among full-time workers a substantial difference in earnings persists. Earnings of full-time retail trade workers averaged about 73 percent of those for full-time workers in all industries. About 65 percent of retail trade employees were in relatively low-skilled, low-paying occupations, such as service, sales, unskilled labor, and clerical work. Only 37 percent of workers in other industries were in these occupations. Thus, given the occupational mix in retail trade, and assuming that service, sales, unskilled labor, and clerical jobs are generally low-paying regardless of industry, it is not unexpected that average earnings in retail trade are lower than in other industries. In both retail trade and all industries combined, workers covered by union contracts tended to earn substantially more than those who were not. However, a much smaller proportion of retail trade workers was covered by union contracts than in other industries. In May 1978, about 1 in 4 wage and salary workers reported that they were covered by a union contract. In retail trade the proportion was 1 in 9.

Table 2. Employment in nonfarm retail trade by occupation and sex, 1978 annual averages

[Numbers in thousands]

Occupation	Men		Women	
	Number	Percent	Number	Percent
Total	7,772	100.0	7,865	100.0

Service	1,253	16.1	2,191	27.9

Table 3. Median usual weekly earnings of wage and salary workers in all industries and retail trade, by sex, full- and part-time status, and union coverage, May 1978

[Workers in thousands]

Category	All industries	Retail trade
Total wage and salary workers	84,968	13,765
Total reporting usual weekly earnings	66,246	10,773
Both sexes	$195	$116
Full-time	227	166
Part-time	61	57
Covered by a union contract	265	179
Not covered by a union contract	165	111
Men	255	167
Full-time	272	217
Part-time	58	57
Covered by a union contract	296	237
Not covered by a union contract	229	160
Women	138	95
Full-time	166	124
Part-time	62	58
Covered by a union contract	198	137
Not covered by a union contract	125	92

There were marked differences in the earnings of male and female workers, both full-time and part-time. The usual weekly earnings for women were about 57 percent of those for men. Women working part time tended to earn about the same as men working part time. Thus, the overall disparity in female-male earnings appears to stem primarily from differences in the earnings paid to full-time workers. As with the inter-industry earnings differential, one possible explanation is occupational differences. Whether they work full time or part-time, women tended to be employed in relatively low-paying sales, service, and clerical jobs. Nearly 80 percent of women working full time and about 85 percent of those working part time were in these three occupations. Men, however, not only engage in a wider array of occupations, but their employment also shows more occupational variation between full-time and part-time workers. For example, nearly 30 percent of full-time male workers were employed as craftworkers and operatives, relatively well-paying occupations, but only 15 percent of part-time male workers were in such occupations. About 37 percent of men were working full time in the low-paying occupations of sales, service, and unskilled labor. Half of the part-timers, however, were in those occupations. This greater proportion of men working full time in better paying occupations may have contributed to the greater difference in pay between men and women working full-time. ☐

——FOOTNOTES——

[1] The data in this article are based primarily on the Current Population Survey (CPS) and its supplements. The Bureau of Labor Statistics regularly publishes industry employment estimates based on the results of two separate surveys, the Current Employment Statistics (CES) program and the CPS. The CES program is generally recognized as the major source of information on employment by industry. CES statistics are derived from a sample survey of business establishments, scientifically selected to represent the industrial structure of the nonagricultural economy. However, CPS results are used in this article. CPS not only provides estimates of employment, hours, and earnings of workers, by industry, but unlike the CES, also yields data on full- and part-time status, occupation, and demographic characteristics of workers, by industry. The differing CPS and CES estimates of employment, hours, and earnings are due to differences in the concepts and coverage of the two surveys. For a comprehensive discussion of this, see Gloria P. Green, "Comparing employment estimates from household and payroll surveys," *Monthly Labor Review*, December 1969, pp. 9–20. For the period of this study 1968–78, employment growth in retail trade as measured by the CES was 4.2 million, comparable to the CPS at 4.1 million.

The retail trade industry includes establishments engaged in selling merchandise for personal or household consumption, and for rendering incidental services. In general, retail establishments are classified by type of business, according to the principal lines of commodities sold (groceries, hardware, etc.), or the usual trade designation (drugstore, cigar store, etc.). Gasoline service stations and eating and drinking places are included in this industry group. Although industries are not always classified in the CPS according to the Standard Industrial Classification (SIC) Manual, its designation of retail trade closely parallels what is included in SIC codes 52–59. See U.S. Bureau of the Census, 1970 Census of Population, *Classified Index of Industries and Occupations.*

[2] See *Survey of Current Business*, Bureau of Economic Analysis, April 1979, pp. 11 and S–12.

[3] The data on paid hours of wage and salary workers in the retail trade industry are based largely on the CES estimates of average weekly hours for production or nonsupervisory workers, and employment data for all employees. For the retail trade industry, these CES data are supplemented by other sources, including the Census, CPS, and the Internal Revenue Service. See *BLS Handbook of Methods for Surveys and Studies*, BLS Bulletin 1910-Chapter 31, Output per employee-hour measures: Industries and the Federal Government.

[4] Average workweeks as measured in the CPS.

[5] See *Multiple Jobholding, in May 1978*, Special Labor Force Report 221, (Bureau of Labor Statistics, 1979).

[6] Most of the information in this section was obtained from studies of trends in output per employee-hour, in various segments of the retail trade industry. See Brian L. Friedman and John L. Carey, "Productivity in gasoline stations, 1958–73," *Monthly Labor Review*, February 1975, pp. 32–37; John Duke, "New car dealers experience long-term gains in productivity," *Monthly Labor Review*, March 1977, pp. 29–33; John L. Carey and Phyllis Flohr Otto, "Output per unit of labor input in the retail food store industry," *Monthly Labor Review*, January 1977, pp. 42–47, and Richard B. Carnes and Horst Brand, "Productivity and new technology in eating and drinking places," *Monthly Labor Review*, September 1977, pp. 9–15.

[7] See Howard Young, "Jobs, Technology, and Hours of Labor: The Future of Work in the U.S.," presented at hearings of the Joint Economic Committee, Special Study of Economic Change, Washington, D.C., June 14, 1978.

[8] See Carnes and Brand, "Eating and drinking places," p. 14, and Labor Information Network, *Employers' Views and Training: A Nonstatistical Approach to Data Gathering*. (New York, 1978).

[9] Work experience data are based on the March 1978 supplement to the CPS. Job tenure data are derived from the January 1978 supplement.

[10] See Carey and Otto, "Retail food stores," p. 44, for a study dealing with the food service industry.

[11] These earnings data for wage and salary workers are derived from the May 1978 supplement to the CPS; they may differ somewhat from the data derived from the CES for reasons noted in footnote 1. The term "usual" as applied to weekly earnings is vague. The reference period applied is not a specific calendar week; the CPS respondents determine the proper application period. It is vital to note that the data may not include earnings from tips. Because the subject is not systematically explored in the CPS interview, the decision whether to include tips is left to each respondent. To the extent that the data do not include earnings from tips, earnings of workers in retail trade, especially those of food service workers, are understated. For a fuller discussion of these earnings data, see Janice N. Hedges and Earl F. Mellor, "Weekly and hourly earnings of U.S. workers, 1967–78," *Monthly Labor Review*, August 1979, pp. 31–41.

[12] The distributions of earnings were computed only for persons who reported their earnings. In May 1978, about 22 percent of all wage and salary earners and a similar proportion of workers in retail trade, did not report their usual weekly earnings. Among workers paid by the hour, in industry as a whole and in retail trade in particular, about 14 percent did not report their earnings in May 1978.

[13] Other factors relating to demand for products and services, the structure of employer-employee relationships, profit margins and equipment usage, etc., contribute to the earnings differentials among industries. Most of these factors are beyond the scope of a research summary; they are mentioned only to round out the range of possible factors underlying the inter-industry gaps in earnings. Since no statistical analysis of these data was performed, no attempt is made to determine the relative contributions of various factors to the rather low earnings in the industry.

Work experience of the population in 1978

ANNE MCDOUGALL YOUNG

More than 110 million persons were employed at some time during 1978, 3.2 million more than in 1977, with women accounting for two-thirds of the increase. Among women who worked, the proportion who worked all year at full-time jobs rose to a record 44 percent (table 1). The proportion of men who worked year round, full time also rose in 1978, returning to the level prevailing before the 1974–75 recession.

As in previous years, millions of Americans continued to move into and out of the labor force during 1978. Many persons were employed only for short periods to fit school or household schedules or seasonal demands. Others entered or left military service, and there

---

Anne McDougall Young is an economist in the Office of Current Employment Analysis, Bureau of Labor Statistics.

was the normal replacement resulting from death, retirement, and disability.[1] The work force also included a total of 17.7 million persons who encountered some unemployment during 1978, about 1.8 million fewer than in 1977. Most of these persons worked during part of the year.

As in earlier years, the proportion of white and Hispanic men who worked during 1978 (82 and 83 percent) was larger than that for black men (73 percent). Hispanic men were the least likely to have worked year round, full time. Among women, the proportion who worked during the year differed little by race or Hispanic origin—averaging about 55 to 57 percent. Black women were more likely than white and Hispanic women to have worked all year at full-time jobs.

Trends in year-round employment

Since 1968, about two-thirds of the increase in the number of women with work experience has been among women who worked all year (table 2). The expansion in year-round employment was greatest among women ages 25 to 34. These are the young women—

[1] According to the 1970 census, 89 percent of this group were black. The others were American Indians, Asians and Pacific Islanders, and other nonwhite races. These data differ slightly from data in table 1 which are for black *only*.

born in the baby boom which followed World War II—who have established a new pattern of labor force participation for their age group. Today they are marrying later, often after several years in the labor market, and returning to work following the birth of children much sooner than did their mothers. In March 1979, 46 percent of all mothers under age 35 with a child under age 6 were in the labor force. Among women of all ages with children under 6 years, 43 percent were in the labor force during all of 1978 (50 to 52 weeks).

Since the early 1970's, black women have—in general—been more likely to work all year full time than white women and that difference persisted in 1978.[3] If women who work all year at part-time jobs are included with year-round, full-time workers, the black-white difference narrows slightly. However, black women under age 25 have consistently been less likely to work all year than white women in that age group, and the difference in proportions increased substantially over the decade (table 3). One of the reasons for this is that more black than white teenagers left school before graduating, and therefore lacked an important credential for jobs which provide steady employment. Also, among young women in the labor force, a higher percentage of blacks than whites had children under age 6. In the 25-to-34 age group, the proportions of both white and black women with year-round employment rose by 7 to 8 percentage points and that for black women ages 35 to 44 jumped even more. The proportions of white and black women with young children were about the same at these ages.

In contrast to the upward trend over the decade in year-round employment among women, the proportion of men with such steady work declined by 3 percentage points and dropped sharply among white and black men 25 to 34 years old—the "baby boom" cohort. Given that men in this age group have traditionally had high labor force participation rates, the decline in year-round employment may indicate some generational crowding with respect to the so-called "good" jobs which offer steady employment.[4] Less year-round work also reflects the larger proportion of men in the age group with some unemployment during 1978 than during 1968 (15.9 versus 11.6 percent); in 1968, the Vietnam war took a large group of men out of the civilian economy, and there was also a high level of business activity.

The over-all figures obscure the sharp decline in year-round work among black men under age 25, in contrast to little change among young white men. Reasons for the deterioration in the employment situation of young blacks have been extensively explored in other reports with reference to their higher school dropout rate, their lack of vocational training, the scarcity of jobs in the inner city, and the range of socioeconomic factors which influence behavior in the labor market.[5] During the past 25 years, the employment situation of young blacks has continued to deteriorate even in times of general economic improvement.[6] In that context, the lower proportion of black teenagers and young adults with year-round work is further evidence of the extent of change.

[3] Worked less than 50 weeks.
NOTE: Because of rounding, sums of individual items may not equal totals.

Occupational changes

The increase in year-round, full-time employment among women reflected movement into occupations which are likely to require a more regular work commitment. Most women who worked all year—both white and black—were employed as professional and technical workers, managers, clerical workers, or service workers. Since 1968, the proportion of women employed year round in professional and technical jobs rose by almost 5 percentage points, was unchanged among managers, and rose 4 percentage points among both sales and clerical workers.

Occupational shifts over the decade were especially dramatic for black women. For example, their year-round employment as private household workers dropped from 23 to 7 percent between 1968 and 1978 (table 4). At the same time, the proportion of black women in clerical work expanded from 20 to 29 percent, and there were substantially more employed in the higher paying white-collar occupations, such as professional and managerial work. Among white women, the proportion in white-collar positions rose from 68 to 72 percent, while the percentage of operatives declined.

The decline in year-round employment among men showed a similar occupational pattern for whites and blacks, with the sharpest drop among transport equipment operatives. Although the number of men in this occupation increased by more than a million from 1968 to 1978, more than half of the increase was among part-year or part-time workers. In 1978, 36 percent of the men in this occupation worked part of the year, compared with 28 percent in 1968. The proportion of men who worked year round in service occupations also declined substantially, as two-thirds of the 2-million increase in employment was among part-year or part-time workers. By 1978, 52 percent of the men in service occupations worked less than year round, up from 45 percent in 1968.

The 17.7 million persons who encountered some unemployment during 1978 represented 15.8 percent of those who were in the labor force for either all or part of the year—the lowest such proportion since the mid-decade recession. In 1977, unemployment had reached 17.8 percent of the persons who were in the labor force (table 5). About 15.7 million, or 9 out of 10 of the persons with some unemployment during 1978, were also employed during part of the year. The number who never held a job—although they engaged in some jobseeking—was about 2.1 million, down from 2.6 million in 1977.

The decline in the incidence of unemployment affected all major labor force groups. The proportion of the work force with some unemployment fell by almost 2 percentage points for men and women, to 15.3 and 16.4 percent respectively. The proportion of white workers encountering unemployment during 1978 was 14.7 percent, while the percentages for blacks and Hispanic workers were, respectively, 25.0 and 21.3, all lower than in 1977. The number of persons accumulating 15 weeks of unemployment or more decreased substantially from 1977 to 1978—from 7.5 to 6.2 million—while the number with comparatively short spells of unemployment was down only slightly. □

FOOTNOTES

[1] The data for this report are based on responses to special "work experience" questions included in the March 1979 Current Population Survey (CPS), conducted for the Bureau of Labor Statistics by the Bureau of the Census. The work experience questions refer, retroactively, to the civilian work experience of persons during the entire preceding year. Because many persons enter and leave the labor force during the course of the year, the number of persons with employment and with unemployment as determined through the work experience questions is much greater than the annual average for the same year based on the monthly survey conducted during the year. Persons who reached age 16 during January, February, or March 1979 are included. However, the work experience of persons who were in the civilian labor force during 1978 but were not in the civilian noninstitutional population in March 1979 is not included; similarly data on persons who died in 1978 or in 1979, before the survey date, are not reflected.

This is the latest in a series of reports on this subject. Data from the March 1978 survey were published in the *Monthly Labor Review* in March 1979 (pp. 53–57) and issued with additional tabular data and explanatory notes as Special Labor Force Report 224. This report will be reprinted with additional data from the March 1979 survey as a Special Labor Force Report later this year.

[2] The rise in the proportion of women who work during the year has been documented in previous work experience reports such as Special Labor Force Report 224 for 1977 and Special Labor Force Report 201 for 1976, both reprints of research summaries in the *Monthly Labor Review.*

[3] In this discussion of year-round employment and occupational changes, "black" refers to black and other races. Data for black, only, were not available for 1968.

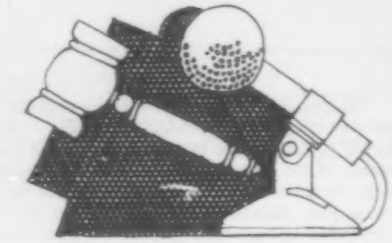
Erratum

In the article "The political and legal issues of binding arbitration in government," appearing in the September issue of the *Review,* the representative of a police bargaining unit in Buffalo was incorrectly identified on p. 39. At the time of the challenged arbitration award, the unit was represented by the Police Benevolent Association.

Conventions



Mine Workers' new president wins dues increase, right to name VP

MARY A. ANDREWS

The United Mine Workers of America saw its new president, Samuel Morgan Church, Jr., gavel his way to victory at the union's triennial convention in Denver, Colo. In the tradition of John L. Lewis, Church won on a number of important issues, including a dues increase, a newly established strike fund, and presidential authority to appoint a vice president.

More than 1,200 delegates, representing 230,000 active and retired members, adopted as a basic theme for the December 10–19 meeting, "unity and rebuilding of the UMW." They revised a number of significant provisions of the union's constitution and formulated guidelines for the 1981 negotiations with the Bituminous Coal Operators Association. For the first time, members of working committees were elected by the delegates, rather than appointed by the president.

In his keynote address, Church invoked the spirit of Lewis, who headed the union for more than 40 years, by urging unity and stressing that "we must once again become the mighty power that we were. With your help, I will see to it that America and its leaders know we are strong, and above all united for the common good of the union. Unity is important to the future of the UMW, the labor movement, and the future of the United States and Canada." All UMW members are in these countries.

Credentials fight

A floor debate erupted during the delegates' consideration of a partial report of the credentials committee, which established the number of votes that were to be cast by the delegates. The convention first rejected this report by a voice vote. This meant that the convention could not formally seat the delegates and begin its business. Accordingly, Church told the delegates they had two options: to recess until the credentials committee report was complete and updated; or to have a roll-call vote on the partial report. The delegates chose a roll-call vote. When it became apparent to Church that the vote would be in favor of accepting the committee's partial report, he suspended the roll-call vote and asked for a voice vote, which resulted in the adoption of the entire report. It was generally agreed by convention delegates that in winning the credentials report battle Church passed his first test of leadership.

Church expressed a desire to appoint his own successor to the post of vice president, citing a need for compatibility. The post had become vacant when President Arnold Miller resigned because of poor health, turning the leadership of the union over to Church.[1]

After a brief but spirited debate, the delegates endorsed a resolution from the floor to waive a provision of the union's constitution requiring a general election to fill the vacancy.[2] Some of the opposing delegates argued that such a waiver was not in the spirit of the democratic process and represented a loss of autonomy for them as representatives of the rank and file. The majority, however, upheld the president's right to pick a vice president. Another consideration was a saving of about $750,000, the cost of running an election. Church chose not to fill the vacancy during the convention. At a press briefing, however, he mentioned that he had narrowed the list of prospective candidates down to about five persons.

Shrinking assets

Willard A. Esselstyn, secretary-treasurer, told the delegates about the union's current financial difficulties, pointing to a decline in the union's liquid assets, from $46 million in 1970 to $2 million in 1979. Loans made by the union to its districts, costly legal settlements, and aid given to striking miners, combined with inflation, have brought the union to its current financial condition. With $2 million left in the bank, approximately the cost of holding the convention, Esselstyn said the union would soon be at the "zero level" unless a dues increase were approved.

Dues increase. On a roll-call vote, following a sharp debate, the delegates approved a constitutional amendment to increase working miners' dues by more than

---

100 percent. The last increase was in 1973. The dues will be about $48 million a year and will be divided equally among the locals, the districts, and the international union. Dues will be raised from the current flat rate of $12 a month to $26.67. Working miners will pay an amount equivalent to 3 hours' wages a month assessed at the grade 1 underground miner wage scale of $8.89 per hour. Linking the dues structure to the hourly wage will automatically raise dues when wages increase. The hourly formula was used to tie dues to inflation and a member's ability to pay. The higher dues level was considered a major victory for Church, who saw it as another test of his leadership. "Give me a chance, give me what I need to work with, and if you don't like my performance, in just 3 years you can get rid of me," he told the delegates.

Some who opposed the change in the dues structure acknowledged that an increase might be needed but asserted that 3 hours' pay a month was too much. They argued that its adoption would make it too difficult to face their members back home, particularly when some of their locals and districts also were having financial troubles. They were also critical of what they called excessive spending by the union's officers, and called upon Church to curtail it. In response, Church promised to review the union's spending and staffing and said that money may be saved.

The dues increase also will provide the UMW with the necessary funds to increase its organizing activities. The organizing committee recommended that specific funds be earmarked for the organizing department, in order to launch an intensive campaign to bring thousands of miners and millions of tons of coal under the UMW's banner. The committee called for an increase in the number of organizers from about 40 to about 150. The present organizing staff has been operating on a budget of about $500,000 a year.

Church told the delegates that his proposal for 50 more Western organizers (currently there are nine) will be a top priority of his administration. Major organizing efforts will be planned in the coal-rich Rocky Mountain West, an area where the UMW is weak and threatened by an increasing number of nonunion operations. But he warned the delegates that such efforts will not be cheap. "If our organizing in the West is to be thorough, we must realize the cost will be huge. 'Big money' will be needed to help organize the rich West."

Strike fund and assessments. The convention approved another constitutional change to establish a strike fund. The International Executive Board will be authorized to call selective strikes against one or more companies which are not members of the Bituminous Coal Operators Association. This will be a major change in UMW's strategy, which usually relies on industrywide work stoppages. The adopted measure calls for the executive board to assess working miners $25 a week to raise the money for striking miners. The new strategy is primarily directed at the Consolidation Coal Co. (Consol) which, last May, withdrew from the association, the coal industry's bargaining arm for 30 years. Consol, which employs about 20,000 of the union's members, plans to negotiate separately with the union during 1981.

In the early days of the convention, the delegates returned to the constitution committee a proposed amendment which would have permitted unlimited yearly assessments to provide for posting of bonds and payment of legal judgments against the UMW. Toward the end of the convention, the delegates authorized the executive board to assess working miners $10 a year for this purpose. The assessment authority is necessary, union officials said, because of the $16 million in potential court judgments facing the union during 1980. The lawsuits were filed by some of the coal operators, largely because of the rash of wildcat strikes that marked Miller's tenure.

Some delegates who spoke asserted that the large dues increase and establishment of a selective strike fund obviated the need for any assessment.

During the convention, it was announced that the U.S. Supreme Court had ruled the UMW International Union is not automatically liable for wildcat strikes.[3] The decision supported a lower court ruling that denied damages to the Carbon Fuel Co. of West Virginia for losses suffered from 48 wildcat strikes by three of District 17's locals during 1969–73. In a unanimous decision written by Justice William Brennan, the Supreme Court ruled that the Taft-Hartley Act, under which the suit was filed, does not impose liability on a parent union for strikes of locals the union did not authorize. In 1947, when Taft-Hartley was enacted, the international union deleted a clause in the national agreement requiring it to take disciplinary or other action to end unauthorized strikes. Because the contract only called for arbitration of disputes and for the union to preserve the integrity of the contract, the court ruled that neither the international nor District 17 could be held liable.

Bargaining goals for 1981

In preparing for UMW's 1981 bargaining rounds, the negotiators may be faced with rapidly changing economic conditions, along with a weakening demand for coal. The Bituminous Coal Operators Association contract, scheduled to expire in March 1981, covers 125,000 workers and has set the pattern for the union's three other major contracts: the Western Surface Coal Agreements (12,000 workers) which expire April 1981,[4] the National Coal Mine Construction Agreement (14,000 workers) which expires March 1981, and the

Anthracite Wage Agreement (2,000 workers) which expires May 1981.

The delegates adopted the collective bargaining committee's report (which is intended as a guide to the negotiators) and asked for higher pay differentials on both the afternoon and midnight shifts, and for an uncapped cost-of-living increase of 1 cent per .3 percentage-point rise in the Consumer Price Index.

In addition, a shorter workweek will be sought, aimed at expanding the number of jobs for miners. Presently, an estimated 20,000 union miners are unemployed, and thousands more are on reduced work schedules because of lagging coal sales.

The committee also proposed that the negotiators of the contract explore the possibility of placing arbitrators under contract. This is intended to ensure that an arbitrator's fee would not be raised during the term of the contract; that bench decisions (usually oral and handed down immediately after a hearing, without recourse to further argument or evidence) be issued when they are mandated by the wage agreement; and that the use of post-hearing briefs be limited to emergency situations only. The committee felt the proposal would "give the parties more control over arbitrators" and possibly ensure that they would uphold the "integrity" of the union's wage agreement.

A broad set of collective bargaining goals designed to protect workers from hazardous and unhealthful work was also adopted. Proposals for the new contract provide that a full-time union safety inspector and a full-time nurse be employed at every mine; the right to strike over unsafe working conditions; the quadrupling of the annual protective clothing allowance paid by the operators to $500; postponement of any new rules disputed by workers for safety reasons until ruled on by an arbitrator; and, safety and health training of employees.

Other floor action

The office of Vice President for Pensioners' Affairs was abolished, to become effective at the end of the incumbent's term in December 1982. Because retirees have the right to vote for local union presidents and vice presidents, they are considered to have adequate representation, making the vice president's job unnecessary.

Also approved was a resolution stripping membership from a worker taking a temporary supervisory job, and requiring payment of a new initiation fee to rejoin the union upon return to the regular job.

Church and other UMW leaders accused the Government of neglecting coal in the U.S. energy program. Church indicated that increasing coal production could free the United States from dependence on the Organization of Petroleum Exporting Countries (OPEC) cartel and provide work for unemployed coal miners. The delegates endorsed a legislative committee report reaffirming legislative goals of the 1976 convention, including a national coal development policy, a curb on nuclear power, breakup of multinational oil companies, and continued regulation of gasoline and domestic oil prices to benefit miners in rural areas.

Guest speakers at the convention included Sen. Edward Kennedy, D-Mass., U.S. Assistant Secretary of Labor, William Hobgood (who delivered Secretary Ray Marshall's speech), and Congressman Nick J. Rahall, D-W.Va. □

FOOTNOTES

[1] The resignation was accepted by the UMW International Executive Board, and Samuel Morgan Church, Jr., was sworn in on November 16, 1979. Under terms of the resignation, Arnold Miller will be designated "president emeritus" and will receive his full salary ($42,000 a year) until the expiration of his term in December 1982. At that time, the International Executive Board will determine whether to continue his salary. Miller won the union presidency in December 1972, defeating W. A. "Tony" Boyle, who subsequently was convicted of conspiracy to murder an earlier rival, Joseph A. Yablonski.

[2] Article V., Section 2(a), UMW Constitution provides that the President shall fill by appointment all vacancies occurring in any International office. However, if at the time a vacancy occurs in the office of vice president, secretary-treasurer, or executive board member, if more than 2 years of the term remains, he shall call for an election to fill the vacancy, the election to be held as promptly as possible.

The amendment to Article V., Section 2(a) reads as follows:

> (b) Notwithstanding the provisions of Section 2(a) above, the President shall fill by appointment the vacancy existing in the office of Vice President which was created by the elevation of former Vice President Samuel Morgan Church, Jr.

[4] Separate agreements expiring at different dates are to be negotiated with individual companies in 1981.

Significant Decisions In Labor Cases

Long leash for wildcats

In one of its first opinions of the 1979–80 term, the Supreme Court clarified the legal responsibility of parent unions when their local affiliates are involved in an unauthorized strike. Unanimously, the Court concluded that, under the National Labor Relations Act, a parent union may be held liable for damages resulting from such strikes when it can be proved that the local acted with the express or implied authority of the parent union. The Court also ruled that the terms of a collective bargaining contract determine whether and to what extent a parent union has an obligation to attempt to resolve unauthorized strikes; failure to fulfill such an obligation also could result in damage liability. Because the United Mine Workers International Union did not instigate, support, ratify, or encourage a series of wildcat strikes between 1969 and 1973 and because the UMW had no contractual obligation to resolve the strikes, it could not be held liable for resulting strike damages, the Court ruled. (*Carbon Fuel Co.*[1])

The Carbon Fuel Co. claimed that a UMW contract provision specifying arbitration of grievances required the international to use "all reasonable means" to end unauthorized strikes. Congressional policy favoring arbitration imposes such an obligation when an arbitration clause exists, the company urged.

Writing for the Court, Justice William Brennan rejected this argument, which had created a conflict among the Circuit Courts of Appeals.[2] The "agency" test of union liability for unauthorized strikes established by Congress, he reasoned, precluded an extension of the policy in favor of arbitration which would impose an obligation on parent unions to intervene. However, Brennan noted that this result did not affect the *content* of arbitration clauses.

Carbon Fuel also claimed that a contract provision requiring the UMW to "maintain the integrity" of the contract obligated the international to attempt to end unauthorized strikes as part of its responsibility under the arbitration clause. On this issue, Brennan relied on elements of the Court's decisions in the *Steelworkers* Trilogy.[3] Essentially, he emphasized that when a contractual agreement is specific the courts may not substitute a different result. Thus, when the parties have agreed not to arbitrate, Federal policy in favor of arbitration cannot impose such an obligation. Brennan noted that, in 1952, specific contract language requiring the UMW to attempt to end unauthorized strikes was deleted. Because such a requirement to intervene had been purposefully negotiated out of the agreement, it could not now be covered by the contract's arbitration provision. Although the full scope of the UMW's responsibility to "maintain the integrity" of the contract was left unsettled, the Court ruled that in light of the parties' bargaining history the union no longer had any obligation to resolve wildcat strikes.

The Court's decision in *Carbon Fuel* made clear that a parent union is not liable for wildcat strike damages when (1) the local did not act as the agent of the parent "in accordance with their fundamental agreement of association"; *and* (2) the parent has fulfilled its responsibility under the collective bargaining agreement to resolve such unauthorized strikes. Thus, where contract language is unclear, a parent union could be held liable for wildcat strike damages if it failed to fulfill obligations found (by a court or an arbitrator) to be contained in the contract.

Landbased longshoring

The availability of compensation for both disability and death suffered by longshoremen and harbor workers was substantially broadened by Congress in 1972. Court interpretations of earlier laws had limited compensation to the disabilities or death that occurred "on navigable waterways." This distinction resulted in cases where workers injured in falls were awarded compensation depending on where they landed—over water or on land.[4] The 1972 law corrected this type of inequity by extending coverage to certain land areas and by covering "any person engaged in maritime employment."

In a 1977 case,[5] the Supreme Court explained that one of the congressional reasons for expanding coverage was the increased use of containerized shipping—which permits traditional longshoring tasks to be performed in a variety of locations. Thus, the Court ruled that workers involved in packing and unpacking containers or

---

"Significant Decisions in Labor Cases" is written by Gregory J. Mounts of the *Monthly Labor Review* staff.

those who, at least part of the time, could be assigned to perform such "indisputable" longshoring tasks were covered by the 1972 law. However, the Court left unresolved whether Congress meant to include other workers who handle ships' cargo within the definition of "maritime employment."

Late in 1979, clear occupational boundaries for coverage under the 1972 law were finally established. Congress meant to include all workers involved in moving cargo between ship and land transportation when it provided injury compensation for maritime employment, the Supreme Court unanimously held.[6] The Court explained that Congress was more concerned with the nature, not the location, of employment. Thus, the entire process of moving cargo from one form of transportation to another remains longshoring even though some intermediate—and integral—steps are now performed away from the water's edge.

The Court's decision approved a ruling by the 5th Circuit that two injured workers—one while fastening vehicles onto railroad flatcars and another while unloading cotton into a pier warehouse—were covered by the law because of the nature of their work. However, specifying both the nature and location of employment makes clear that not all who work within the land areas designated in the law are covered. Persons whose responsibility is only to pick up cargo for further transshipment are not covered despite the fact that they work at a marine situs, the Court emphasized.

The costs of discrimination

In another case decided early in its 1979–80 term, the Supreme Court ruled that Federal funds available under the Emergency School Aid Act may be denied to elementary and secondary schools based on statistical evidence of a disparate racial impact in the hiring, promotion, or assignment of employees.[7]

Congress made funds available under the law to defray the costs associated with the "elimination of minority group discrimination" and to encourage the adoption of such desegration programs. Schools compete for a limited amount of total funds, but become ineligible if they have engaged in certain discriminatory employment practices specified by the law. However, the ambiguity of the law's ineligibility provision had left it unclear whether schools could be denied aid based on the discriminatory *impact* of their practices or whether denial could be based only on proof of discriminatory *intent.*

The Court reasoned that Congress intended to provide financial assistance to schools, in part, as an enticement to encourage voluntary elimination of *de facto* as well as *de jure* minority group segregation and isolation. To disqualify only those applicants with a conscious intent to perpetuate racial isolation would defeat the congressional objective of ending both forms of discrimination, the Court declared.

In approving the use of an impact test, the Court explained that a school could possibly rebut the disparate effect shown by statistical evidence by proof of "educational necessity," analogous to the "business necessity" justification applied under Title VII of the 1964 Civil Rights Act.

Finally, the Court addressed the question of denying antidiscrimination aid to some of the actual victims of discrimination:

> There is no force in the suggestion that a decision adverse to the Board here will serve to harm or penalize the very children who are objects of the beneficial provisions of the act. A ruling of ineligibility does not make the children who attend New York City schools any worse off; it does serve to deny them benefits that in theory would make them better off. The funds competed for, however, are not wasted, for they are utilized, in any event, to benefit other similarly disadvantaged children. It is a matter of benefit, not of deprival, and it is a matter of selectivity. ☐

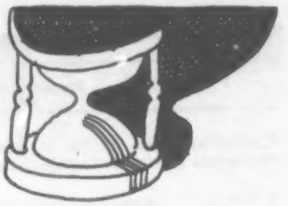
Major Agreements Expiring Next Month



This list of collective bargaining agreements expiring in April is based on contracts on file in the Bureau's Office of Wages and Industrial Relations. The list includes agreements covering 1,000 workers or more.

Employer and location	Industry	Union[1]	Number of workers
Area Grocery Contract (Minnesota and Wisconsin)[2]	Retail trade	Food and Commercial Workers	1,200
Associated Contractors of Ohio, Inc., 2 agreements (Ohio and Kentucky)	Construction	Carpenters; and Operating Engineers	5,500
Associated General Contractors of America:			
Central Illinois Builders Chapter	Construction	Carpenters	1,600
Chattanooga Chapter (Alabama, Georgia, and Tennessee)	Construction	Carpenters	1,200
Mid-Florida, and 1 other association	Construction	Carpenters	2,200
New Orleans Chapter (Louisiana)	Construction	Building and Construction Trades Council	7,350
Northeastern Florida Chapter (Florida and Georgia)	Construction	Carpenters	1,500
Ohio Building Chapter, 2 agreements	Construction	Carpenters; and Laborers	4,500
St. Louis Chapter, 2 agreements (Missouri)	Construction	Carpenters; and Laborers	7,700
Bendix Corp., Master Agreement (Interstate)	Transportation equipment	Auto Workers (Ind.)	6,900
Borg-Warner Corp., York Division (Decatur, Ill.)	Machinery	Allied Industrial Workers	1,200
Builders of Tazewell County and 5 others (Peoria, Ill.)	Construction	Carpenters	4,300
California Conference of Mason Contractors Association, Inc. (Los Angeles, Calif.)	Construction	Bricklayers	1,000
Caterpillar Tractor Co. (California)	Machinery	Machinists	1,400
Charmin Paper Products Co. (Green Bay, Wisc.)	Paper	Paperworkers	1,500
Chicago Lithographers Association (Illinois)	Printing and publishing	Graphic Arts	4,800
Cities Service Co., Copperhill Operations (Copperhill, Tenn.)	Mining	Chemical Workers	1,200
Clark Equipment Co., Industrial Truck Division (Battle Creek, Mich.)	Machinery	Allied Industrial Workers	2,000
Clark Equipment Co., Transmission Division (Jackson, Mich.)	Transportation equipment	Allied Industrial Workers	1,500
Cleveland Electric Illuminating Co. (Ohio)	Utilities	Utility Workers	2,700
Construction Employers Association, Inc. (Kentucky and Indiana)	Construction	Carpenters	2,000
Construction Employers Association, Inc. and 2 others (Kentucky)	Construction	Laborers	3,000
Contractors Association of Eastern Pennsylvania	Construction	Carpenters; Laborers; and Teamsters (Ind.)	4,500
Dayco Corp., Southern Division (Waynesville, N.C.)	Rubber	Rubber Workers	1,600
Dayton Tire & Rubber Co. (Dayton, Ohio)	Rubber	Rubber Workers	1,350
Denver Metropolitan Retail Grocers (Colorado)[2]	Retail trade	Food and Commercial Workers	1,200
ESB Inc., Automotive Division (Interstate)	Electrical products	Auto Workers (Ind.)	1,000
Exxon Corp., Exxon Co., U.S.A., Refinery and Chemical plants (Baytown, Tex.)	Petroleum	Gulf Coast Industrial Workers Union (Ind.)	1,500
Fischer & Porter Co., and 2 others (Pennsylvania)	Instruments	Independent Union of Rotamaster Workers	1,500
Formica Corp. (Cincinnati, Ohio)	Rubber	Electrical Workers (IBEW)	1,050
General Public Utilities Corp., Metropolitan Edison Co. (Pennsylvania)	Utilities	Electrical Workers (IBEW)	1,550
Gould, Inc. (Interstate)	Electrical products	Electrical Workers (IBEW)	1,200
Great Atlantic & Pacific Tea Co., Inc., Grocery Division (Horseheads, N.Y.)	Food products	Teamsters (Ind.)	1,700
Heavy Constructors Association (Kansas and Missouri)	Food products	Operating Engineers	1,750
Home Builders Association (St. Louis, Mo.)	Construction	Carpenters	2,200
Hoover Co. (Canton, Ohio)	Electrical products	Electrical Workers (IBEW)	3,200
Keystone Consolidated Industries, National Lock Division (Rockford, Ill.)	Fabricated metal products	Auto Workers (Ind.)	1,200
Luggage and Leather Goods Manufacturers Association (New York, N.Y.)	Leather	Leather Goods, Plastic and Novelty Workers	1,500
Mason Contractors Association of Baltimore, Inc. (Maryland)	Construction	Bricklayers	1,000
Meat Drivers (Chicago, Ill.)[2]	Food products	Teamsters (Ind.)	1,200

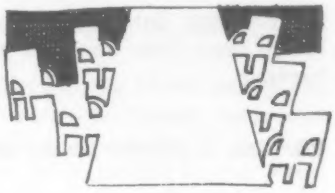
Developments in Industrial Relations



Anti-inflation unit urges higher pay lid

The Council on Wage and Price Stability received the recommendations of the Pay Advisory Committee, the 18-member body established as part of the "national accord" between the Administration and organized labor. (See *Monthly Labor Review*, February 1980, p. 12.)

The Pay Advisory Committee's most important recommendation was that the 7-percent standard for annual pay increases be replaced by a 7.5- to 9.5-percent standard. Apparently, this figure was a compromise between labor and business members of the committee. AFL–CIO President Lane Kirkland indicated that unions could accept the standard, saying, "If it had been any worse we couldn't have taken it, and if it had been any better, we wouldn't have gotten it." Committee member R. Heath Larry, former vice chairman of United States Steel Corp., called the new standard "realistic."

The council did not begin applying the new standard to wage settlements and determinations, pending development of criteria for assessing the size of particular settlements and determinations.

Other proposals ease the rule under which employees may receive pay increases above the guidelines if they have traditionally maintained a "tandem" relationship with those of other workers. The major aspects of this policy include:

- Permitting employee units not covered by automatic cost-of-living clauses to maintain historic pay relationships with units that have such clauses.
- Allowing employers to implement above-guidelines increases themselves, rather than seeking council approval. However, employers should be able to prove a tandem relationship.
- No longer requiring identical increases in a tandem relationship, but employers must be able to justify the difference.
- No longer requiring the leader in a tandem relationship to be in the same industry or geographic area. However, the leader must be exempt from or in compliance with the guidelines.

The latter requirement was first applied in January, when the council ruled that the September agreement between General Motors Corp. and the Auto Workers could not serve as the basis for a tandem exception to the guidelines for other companies because the accord exceeded the pay standards. (However, the council did not press General Motors to renegotiate the contract because the company had pledged to adhere to the price standard during the second year of the program, rather than use the alternative profit-margin standard that could permit larger increases.) The January ruling was in response to "numerous inquiries," particularly from the auto parts manufacturers which have traditionally followed the bargaining lead of the major auto companies.

Also, the committee recommended that the cost of contracts with wage escalator clauses be determined assuming that the Consumer Price Index will rise 7.5 percent a year.

The council accepted the committee's recommendation that longevity pay raises be excluded when calculating whether a unit of employees is in compliance with the pay standards. Previously, longevity increases were considered, while pay raises resulting from "legitimate promotions and qualification increases" were excluded. A council official said the change was made because employers were having difficulty distinguishing between raises based on length of service and those based on increased skills.

Another change accepted by the council permits all employees in units with average hourly earnings of $5.35 or less to be excluded from the pay standards. The existing regulation, which permits the exclusion of any worker earning less than $4 an hour, was retained.

In the committee's view, pay adjustments below the low end of the range may occur depending on criteria such as industry practice, prevailing competitive conditions, ability to pay, and prior levels of settlements. Pay adjustments above the range may occur in circumstan-

"Developments in Industrial Relations" is prepared by George Ruben and other members of the staff of the Division of Trends in Employee Compensation, Bureau of Labor Statistics, and is largely based on information from secondary sources.

ces involving criteria such as productivity improvements, acute labor shortage, gross inequity, or undue hardship.

Chrysler employees accept pay concessions

Chrysler Corp.'s bleak financial outlook was improved when the Auto Workers acceded to the requirements of emergency Federal legislation (the Chrysler Corporation Loan Guarantee Act of 1979) and agreed to a cut in the cost of its 3-year contract with Chrysler. The concessions of $243 million from the pattern of settlements with General Motors Corp. and Ford Motor Co. were in addition to the $203-million concessions in the October Chrysler accord. (See *Monthly Labor Review*, December 1979, pp. 55–57.) As a result, the Federal Government agreed to back loans obtained by the company.

Under the second agreement, Chrysler employees represented by the Auto Workers will receive 3-percent wage increases in March of 1980, 1981, and 1982. (The October settlement provided for increases in March 1980 and January and November of 1981.) There was no change in the 24-cents-an-hour cost-of-living "travel" increase, which was effective September 17, 1979.

Another concession is that employees will not receive any paid personal holidays during the 3-year contract which ends September 14, 1982. The UAW-represented workers will not receive their December 1980 bonus payment—equal to one day's pay—although they did receive the bonus in December 1979 and will receive another in December 1981. Under the October settlement, the workers would have received 9 paid personal holidays in 1981 and 11 in 1982, plus all three of the December bonuses.

The loan guarantee act also obligated Chrysler to give $162.5 million in company stock to its employees. The distribution will be made over a 4-year period, scheduled to begin in July 1980. (This was in addition to a stock ownership plan negotiated in October.) Stock distributed to employees will equal the value of Federal tax credits on certain investments for machinery and equipment. Employees also may invest in additional shares, up to certain limits, with the company matching the amount.

These additional cost concessions and the stock distribution do not apply to the Chrysler employees the UAW represents in Canada. In a separate vote, the Canadian workers rejected the further concessions. Because of this, Chrysler agreed that all of the additional savings resulting from the second accord will be spent in the United States. The union also informed Chrysler that in 1982 it will bargain separately with the company for its members in the two countries.

Seven other unions, representing 4,000 Chrysler workers in the United States, agreed to a total of $16.5 million in concessions, similar to that in the UAW settlement.

U.S. Steel plans plant closings

Plant closings and resulting losses of jobs loomed as an even more important issue in the 1980 steel negotiations, after U.S. Steel Corp. announced that it was closing more than a dozen plants in eight States and permanently laying off about 13,000 workers.

The action was described as "an economic tragedy" by United Steelworkers President Lloyd McBride, who called for immediate Government steps to aid the terminated workers. He said the union would attempt to head off any further closings in the industry by initiating negotiations with management whenever it believes that efforts to modernize and maintain facilities are inadequate.

U.S. Steel Board Chairman David M. Roderick said the facilities scheduled for closing had "become noncompetitive for a variety of reasons, including operating costs, unfairly priced imports, or excessive environmental spending requirements."

The impact was particularly severe in the Youngstown, Ohio, area, where the decision to lay off 4,000 employees was followed by Jones & Laughlin's decision to close a plant with 1,300 employees. (In 1977, Youngstown Sheet and Tube Co. closed a Youngstown plant that had 4,000 employees.)

American Bridge Division plants in Ambridge and Lawrenceville, Pa., were saved from closing after employees reversed their earlier decision and agreed to wage concessions the company said were necessary to make the plants competitive with other steel fabricators. U.S. Steel said that a cost disparity had developed because the two fabrication plants, and a third in Gary, Ind., were covered by the company's contract for basic steel production units, where wages and benefits substantially exceed those at the other fabricators.

The concessions provided that employees of the Ambridge and Lawrenceville plants will receive all benefit improvements included in the 1980 basic steel settlement, but they will not receive the specified wage increases, and their wage escalator adjustments will be limited to 25 cents for each contract year.

U.S. Steel announced that the Gary plant, which was not on the original closing list, would be shut down in 1980. Plant employees again voted to reject the company's request for cost relief.

Government unveils plan to control carcinogens

The Department of Labor announced the first comprehensive Federal policy to identify and protect workers from cancer-causing substances. The new approach, scheduled to become effective in April, is subject to legal challenges by several industry groups, which generally contended that the rules were unclear, excessively rigid, and would be too costly to the industry.

Eula Bingham, assistant secretary of labor for occupational safety and health, said the change would permit at least 10 additional workplace carcinogens to be controlled each year, in contrast to the previous case-by-case approach, which brought 21 carcinogens under controls during the agency's 9-year existence. The substances to be brought under control would be selected from a list of about 500 agents that are suspected of causing cancer. Substances will be designated as "category 1" if scientific testing indicates that they pose a grave danger to workers and "category 2" if there is evidence "suggestive" of the danger of cancer.

Under the new procedures, employers would be required to reduce worker exposure to category 1 substances to "the lowest feasible level," primarily through engineering and work practice controls. If there is a suitable substitute, category 1 substances could be banned entirely. Category 2 substances would be subject to additional testing, but the Occupational Safety and Health Administration could issue temporary emergency standards governing the use of substances in either category.

The industries complained that the new regulations do not require a "cost-benefit" analysis before a standard is imposed. However, OSHA officials said that they do consider the impact on an industry before making a decision. A Federal Circuit Court of Appeals had ruled in favor of the cost-benefit approach in a case involving the benzene standard. A Supreme Court appeal was pending. (See *Monthly Labor Review*, March 1979, p. 68.)

Another objection was OSHA's approach to "negative" evidence produced by studies on humans. Previously, OSHA had ignored such studies. Under the new approach, it will consider the results of negative studies, but only if they examine evidence over a 30-year period, including 20 years of worker exposure, and if the sample studied is large enough to minimize the impact of "confounding variables."

Barbers and Beauticians union plans merger

The Barbers and Beauticians union tentatively agreed to merge into the Food and Commercial Workers union. President Richard A. Plumb of the Barbers and Beauticians said the major reason for the move was that his union did not have the resources to organize the chain beauty shops and barber shops that are supplanting independent shops. The Food and Commercial Workers already represent employees in many shopping malls and department stores in which the new shops are located.

The Barbers and Beauticians, with 35,000 members in 417 locals in the United States and Canada, dates back to the 1800's. The Food and Commercial Workers, which resulted from the 1979 merger of the Retail Clerks and the Meat Cutters, is the AFL-CIO's largest affiliate. It has 1.3 million members, and also dates back to the 1880's.

Plumb said that the merger was expected to be effective in April, after completion of a vote by the union's members. Under the proposal, Plumb would be a vice president of the Food and Commercial Workers and head its new Barbers and Cosmetologists Division.

In another merger development, the International Typographical Union and the Newspaper Guild announced agreement on the structure and authority of leaders of their new organization, as well as on major elements of the method for sanctioning strikes. Union officers participating in the negotiations said they expected the merger to be effective in January 1981.

Forest products workers form new federation

In a move to strengthen their organizing and bargaining, four unions in the West Coast forest products industry have formed the United Federation of Industrial and Tidewater Labor Organizations. The units, with a total membership of 300,000, are the International Longshoremen's and Warehousemen's Union (ILWU); the Western Council of the Lumber Production Industrial Workers; Region 3 of the International Woodworkers of America (a unit of the Carpenters and Joiners); and the Association of Western Pulp and Paper Workers.

ILWU President Jim Herman, who was elected chairman of the new organization, said it was formed in response to the unified approach of employers in 1978 bargaining with the Paper Workers, which prevented the union from attaining its goal of 2-year contracts at all companies. He stressed that each of the four organizations will be "fully, completely and totally autonomous."

New contract for New York State employees

About 47,000 scientific, professional, and technical employees of the State of New York were covered by a 3-year initial contract negotiated by the Public Employees Federation, an affiliate of both the Service Employees and the American Federation of Teachers. The settlement ended 8 months of negotiations that began after the Federation was certified as bargaining agent for the employees. The Federation had defeated an incumbent Civil Service Employees Association in a 1978 representation election.

The contract provides for three annual raises of 7 percent each, a single 9-percent increase for employees hired after April 1, 1979; establishment of a joint committee financed by the State to "assist employees in developing their full professional potential;" establishment of a "prevailing wage" concept for registered nurses under which their salary scales will be linked to those in private industry in the area; lifting of a moratorium on the reclassification of jobs; improvements in hospital, medical, optical, and prescription drug benefits; and a provision for a study of "deferred compensation" for employees.

Cleveland teachers approve contract, end strike

Cleveland's 5,000 public schoolteachers ended an 11-week strike by approving a new 2-year contract that provided for an immediate salary increase of 10 percent, a 4-percent increase in September 1980, and 5 percent in January and April of 1981. The teachers, members of the Cleveland Teachers Union (an affiliate of the American Federation of Teachers), had earlier rejected two offers, and the strike developed into the longest in the system's history.

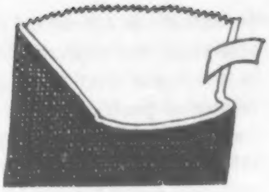
In the wake of the settlement, the school board began discussions with the teachers on how to attain the required 180 days a year of school for the 92,000 students without resorting to overtime, which would cost $200,000 for each Saturday session.

Women workers at Kellogg get back pay

The Kellogg Co. agreed to settle charges of alleged job discrimination against women at its Omaha, Neb., plant. Under the settlement, the company will give $155,950 in back pay to 287 women employees; 140 of this group will get an additional $141,750 in "incentive pay" as an encouragement to work in "nontraditional job areas." The cereal maker also agreed that 40 percent of the people the company hires as laborers and mechanics will be women.

The Department of Labor's charges of job discrimination were based on the assertion that women at the facility were concentrated in lower paying jobs and were not given a chance to compete for jobs usually held by men. ☐

Book Reviews



Global economic guidelines—take your pick

Challenges to a Liberal International Economic Order. Edited by Ryan C. Amacher, Gottfried Harberler, and Thomas D. Willett. Washington, American Enterprise Institute for Public Policy Research, 1979. 448 pp.

Rich and Poor Nations in the World Economy. By Albert Fishlow, Carlos F. Diaz-Alejandro, Richard R. Fagen, and Roger D. Hansen. New York, McGraw-Hill Book Co. for 1980's Project/Council on Foreign Relations, 1978. 264 pp.

Although these two collections are linked by a common issue, the proper structure for the international economic system, they are very different in style, economic substance, and political ideology. At the stylistic level, *Challenges to a Liberal International Economic Order* is a more massive book, both in volume and tone. The conference papers presented are academic in character, intended for someone with a specialized policy interest in the international economic order. *Rich and Poor Nations in the World Economy* is, in contrast, a collection of prescriptive essays that could be read by a well-informed general reader with an interest in foreign economic policy.

The papers in *Challenges to a Liberal International Economic Order* tie together three broad themes. First, the best structure for an international economic regime is the free trade, open market, floating exchanges world that is the subject of neoclassical trade and payments theory. While the contributions stop short of advocating complete *laissez faire,* it is the logical ultimate in liberal economic orders. Second, liberalized economic regimes, and especially the relatively liberal postwar system of the General Agreement on Tariffs and Trade and Bretton Woods, are mutually beneficial to all participants. The third is that the relatively liberal order is under attack and in certain critical areas is crumbling. Two sources of antiliberal pressure are identified, a "new protectionism" on the part of the industrialized developed countries, and the demands for a New International Economic Order.

The argument against the latter, to the extent that such a program involves illiberal international economic practices, is based on empirical work. Jagdish N. Bhagwati's commentary suggests:

> . . . one must go to the evidence to choose the desirable policy framework and that here, 'by and large,' 'more or less' (two splendid English phrases!), the lessons are clear. The outward-looking or export-promoting countries *have* done better than others cross-sectionally; the shift from protectionist to liberal trade and payments policies has *also* helped individual countries, according to time series evidence.

For a more complete statement of this position, Gottfried Harberler's paper, "The Liberal Economic Order in Historical Perspective," is recommended as one of the centerpieces of the collection.

My reading of the basic sense of this conference on the liberal order is that the ascendance of a "new protectionism" on the part of the advanced industrial market economies is a far more serious problem for the liberal order than the demands of a New International Economic Order. Jan Tumlir's urgent essay entitled "The New Protectionism, Cartels, and the International Order" is the key to understanding this point of view. Tumlir first outlines the two major economic forms the new protectionism takes: Cartel, especially popular among Europeans; and proposals for the "fair organization" of the international trade order. Tumlir next develops a very perceptive political model; he sees domestic politics being increasingly fragmented by strong interest groups and domestic politicians responding by defining an increasingly large array of national objectives. In Tumlir's words, "Our political life consists largely of politicians making promises to organized groups. Because each promise entails a function for government, our political life consists largely of government soliciting additional functions for itself."

Even domestically, Tumlir sees that this form of politics can lead to mutual incompatibilities, and, as a result, even domestic economic planning ("organization") breaks down into ". . . political negotiation, an endless series of tests of power, the corporate state—a mutant incapable of survival because it cannot live at peace with its neighbors." The implications of this for the international order are clear: There are objectives in the national array for which the international order is a necessary condition, in the sense that it prevents the

best copy available

predations of others on the array of national objectives; and there are objectives for which it is an impediment, in the sense that it proscribes the export of domestic economic problems. The problem is to construct an international order whose principles are such that universal compliance would not lead to the contradictions that are present now. Two conditions must be met before such an international order may be obtained. First, democratic governments must reject the view that they are merely passive conduits for the objectives of organized political groups, and policymakers must again define their role as reconciling and mediating the interests of various groups in such a way as to build some consensus on a truly national interest. Second, the international order must be constructed in such a way that it actually forces nations to adopt optimal policies. In the field of international economic transactions, theory leads us to believe that this policy is nondiscriminatory noninterference, that is, liberal trade. Tumlir believes that in this manner we would construct an international economic order such that national interest could always be equated to the development and support of the internationl trade and transactions regime.

Rich and Poor Nations in the World Economy presents the centrist, left-liberal, and radical leftist views on the need *for*, and shape of, a New International Economic Order. Albert Fishlow's essay is the most moderate piece offered. The economic paradigm that he centers his work on is an orthodox vision of international market forces straining to achieve the efficiency of the perfectly competitive equilibrium. While there are admittedly major institutional obstacles in the way (and Fishlow will admit to much more than the contributors to *Challenges to a Liberal International Order),* the ideal is still the free interplay of economic forces, guided by the maximization motive. Fishlow's policy prescription follows easily from this outlook; he offers a very generous package of institutional reforms, commodity fund finance, and other *ad hoc* measures that would add up to ". . . a limited reform modifying some of the objectionable features of the present system which could satisfy the limited objectives of all."

Politically, Fishlow sees a world of sovereign nation-state actors engaged in policymaking exercises designed to maximize the national interest. In this political model, the maximizing solution is quite probably a policy package similar to Fishlow's, assuming that all the actors define their interest in and around what Tumlir would call the "array" of economic objectives. I think that this is an overly naive and optimistic analysis of the international politics of the New International Economic Order. Perhaps the most ironic example of his misreading of the politics of the less developed countries, especially his assumption that their goals are reform, not rejection, of the current order, is his use of a short quote from the Shah of Iran's oil minister to support his contention of moderation in the less developed countries. A year later, of course, the Shah himself was violently replaced by virulently rejectionist forces.

Carlos F. Diaz-Alejandro takes a much less sanguine view of the economics and politics of the New International Economic Order. His economics draws heavily on the literature of industrial organization and oligopoly. In his view, oligopolistic "centers" take exploitative advantage of their "peripheries" in a chain that runs internationally from the developed centers to the hinterlands of the less developed countries through the institution of the transnational corporation. In his political model, these same multinationals undermine the sovereignty of states, especially less developed states, to such an extent that reform is a politically impractical solution to the problem of a new order. His prescription stops short of what he terms "complete delinking" from, or rejection of, the current system, noting that the most recent example of complete delinking has been Cambodia. The scenario he favors he calls "selective delinking," which involves guaranteeing the less developed countries the political sovereignty necessary to disengage from, or engage minimally in, an international market that is oligopolistically organized in a manner disadvantageous to those countries involved. Conversely, the less developed countries should selectively enter markets that are organized competitively (or, better yet, in ways that favor them). Diaz-Alejandro's political analysis seems to me to be much shrewder than Fishlow's, but the reader might take issue with much of his economics, especially the automatic assumptions about the malevolence of the transnational corporations.

Richard R. Fagen has written an essay profoundly pessimistic of the possibility of reform of the international economic order in any way that will meaningfully address the issues of international or intranational equity. His economics and politics both draw heavily on a Marxist base, and, therefore, are difficult, to the point of impossibility, to analyze separately. Fagen proposes that the world is dichotomous—on one hand a hierarchy of capitalist bourgeois elites, on the other an exploited (mainly) less-developed subproletariat. In his analysis, the structural incentives in, and institutional framework of, the current order provide little hope for a policy that would meaningfully alleviate either the problem of absolute poverty among members of the subproletariat or of maldistribution of income between the classes. Implicit in his views are an economic model similar to, but far more radical than Diaz-Alejandro's, and a political viewpoint dominated by the perception that sovereign national policies are shaped entirely by the concerns of the financial and commercial interests within the state. I happen to disagree with both analyses, but one must recognize that these ideas do exist, and are much more favorably received by analysts in the less developed countries than by economists in the advanced capitalist nations. Fagen must be commended for the force and clarity with which he presents his alternative paradigm.

A union's struggle in the South

The Knights of Labor in the South. By Melton Alonza McLaurin. Westport, Conn., Greenwood Press, 1978. 232 pp. (Contributions in Labor History, 4.) $16.95.

The Southern States are usually thought of as antiunion in a rather sweeping sense, referring to attitudes of both employers and employees. Recent events are changing this image somewhat, but for many years it was a widely held stereotype. How wrong such common stereotypes can be is vividly illustrated in this fascinating history, *The Knights of Labor in the South.*

In 1885, the first district of the Knights in the South was formed in Richmond, and there had been some successful organizing activity in Georgia and Alabama as early as the 1870's. While the Knights functioned very briefly in the South as a large organization with significant impact, the history of their organizing work and local activities shows a clear interest on the part of Southern workers in banding together to obtain better wages and working conditions.

The author's careful, detailed account begins with an interesting sketch of general economic conditions in the post-Civil War South, describing the newly developing industries and burgeoning cities. Textiles, lumber, tobacco, mining, and iron became important early; employment in these industries grew, creating many of the same industrial relations problems that arose also in the North.

Another background chapter, "The Southern Labor Force," delineates differences between the South and the North, pointing out that the South continued to be basically an agricultural region for many years, even into the 20th century, with close to 90 percent of its population living in rural areas. Therefore, industrialization and related labor union growth could not possibly parallel that in the North.

The author presents statistics on wages and gives other information on the long hours and bleak conditions commonly endured by Southern workers of the period. The power of the employer and the near-hopeless situation of many of the workers is brought out graphically.

The main part of the book traces the growth of the Knights of Labor in the Southern States and describes their activities in several fields: organizational work; relationships with black members; strikes and boycotts undertaken by Knights' members in the South; political activities; work in educational and cooperative endeavors. Only the latter two activities were truly consistent with the original objectives of the national organization; the author explains how the circumstances of the workers, however, inevitably drew them into conflict with their employers, led to strikes and boycotts, and into efforts to better themselves through political means.

The Knights of Labor was not, because of limitations imposed by its national leaders, an organization well-suited to the needs of Southern industrial workers, but it offered the first hope to many of them for improvement and they joined, trying to adapt the organization to serve their interests. They were disappointed time after time when, in desperation, they asked for strike aid, or even speakers and organizers from the national organization, and received nothing.

What the Knights' organization did accomplish in the South was to introduce the idea of a union among the workers and give them some practical experience in operating one. There were more failures than successes in the history of the Knights in the South, and some of the failures, such as the lost strike at the textile mill in Augusta, Ga., described in the book, were tragic.

The author has assembled an impressive amount of detailed information about the activities of the various local groups of the Knights, and the people who participated. He has organized the subject matter in a logical way, pointing up the significance of the events from several perspectives.

Many of the problems that faced the early organizers of the Knights remain, in some degree, today. This book provides excellent historical background for the study of industrial relations in the South today; in addition it is an absorbing tale about the aspirations and struggles of some very brave workers of an earlier era.

The author is a professor of history at the University of North Carolina, Wilmington, and has written a previous volume on labor history, *Paternalism and Protest: Southern Cotton Mill Workers and Organized Labor, 1875–1905.* His new book is a scholarly work based mainly on extensive research in primary sources, such as the Terence Powderly and John W. Hayes papers. There are many footnotes and a full bibliography. It is by no means dull, however, and is recommended for general reading as well as for reference use by specialists.

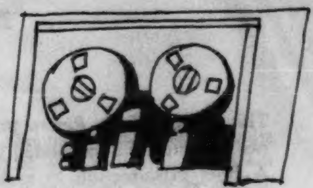
Current Labor Statistics



Notes on Current Labor Statistics 66

Schedule of release dates for major BLS statistical series 66

Employment data from household survey. Definitions and notes 67
1. Employment status of noninstitutional population, selected years, 1950–78 67
2. Employment status by age, sex, and race, seasonally adjusted 68
3. Selected employment indicators, seasonally adjusted 69
4. Selected unemployment indicators, seasonally adjusted 70
5. Unemployment rates, by age and sex, seasonally adjusted 71
6. Unemployed persons, by reason for unemployment, seasonally adjusted 71
7. Duration of unemployment, seasonally adjusted 71

Employment, hours, and earnings data from establishment surveys. Definitions and notes 72
8. Employment by industry, 1949–78 73
9. Employment by State 73
10. Employment by industry division and major manufacturing group 74
11. Employment by industry division and major manufacturing group, seasonally adjusted 75
12. Labor turnover rates in manufacturing, 1976 to date 76
13. Labor turnover rates in manufacturing, by major industry group 76
14. Hours and earnings, by industry division, 1947–78 77
15. Weekly hours, by industry division and major manufacturing group 78
16. Weekly hours, by industry division and major manufacturing group, seasonally adjusted 79
17. Hourly earnings, by industry division and major manufacturing group 80
18. Hourly Earnings Index, by industry division 80
19. Weekly earnings, by industry division and major manufacturing group 81
20. Gross and spendable weekly earnings in current and 1967 dollars, 1960 to date 82

Unemployment insurance data. Definitions and notes 83
21. Unemployment insurance and employment service operations 83

Price data. Definitions and notes 84
22. Consumer Price Indexes, 1967–78 85
23. Consumer Price Index, U.S. city average, general summary and selected items 85
24. Consumer Price Index, cross classification of region and population size class 91
25. Consumer Price Index, selected areas 92
26. Producer Price Indexes, by stage of processing 93
27. Producer Price Indexes, by commodity grouping 94
28. Producer Price Indexes, for special commodity groupings 96
29. Producer Price Indexes, by durability of product 96
30. Price indexes for the output of selected SIC industries 96

Productivity data. Definitions and notes 99
31. Indexes of productivity and related data, 1950–78 99
32. Annual percent change in productivity and related data, 1968–78 100
33. Indexes of productivity, hourly compensation, and unit costs 100
34. Percent change in productivity, hourly compensation, and unit costs 101

Labor-management data. Definitions and notes 102
35. Wage and benefit settlements in major collective bargaining units 102
36. Effective wage rate adjustments going into effect in major collective bargaining units 103
37. Work stoppages, 1946 to date 103

NOTES ON CURRENT LABOR STATISTICS

This section of the *Review* presents the principal statistical series collected and calculated by the Bureau of Labor Statistics. A brief introduction to each group of tables provides definitions, notes on the data, sources, and other material usually found in footnotes.

Readers who need additional information are invited to consult the BLS regional offices listed on the inside front cover of this issue of the *Review*. Some general notes applicable to several series are given below.

Seasonal adjustment. Certain monthly and quarterly data are adjusted to eliminate the effect of such factors as climatic conditions, industry production schedules, opening and closing of schools, holiday buying periods, and vacation practices, which might otherwise mask short-term movements of the statistical series. Tables containing these data are identified as "seasonally adjusted." Seasonal effects are estimated on the basis of past experience. When new seasonal factors are computed each year, revisions may affect seasonally adjusted data for several preceding years. For a technical discussion of the method used to make seasonal adjustments, see "Appendix A. The BLS Seasonal Factor Method," *BLS Handbook of Methods for Surveys and Studies*, Bulletin 1910 (Bureau of Labor Statistics, 1976), pp. 272–78, and *X-11 Variant of the Census Method II Seasonal Adjustment Program*, Technical Paper No. 15 (Bureau of the Census, 1967). Seasonally adjusted labor force data in tables 2–7 were last revised in the February 1980 issue of the *Review* to reflect the preceding year's experience. Beginning in January 1980, the BLS introduced two major modifications in the seasonal adjustment methodology for labor force data. First, the data are being seasonally adjusted with a new procedure called X-11/ARIMA, which was developed at Statistics Canada as an extension of the standard X-11 method. A detailed description of the procedure appears in *The X-11 ARIMA Seasonal Adjustment Method* by Estela Bee Dagum (Statistics Canada Catalogue No. 12-564E, September 1979).

The second change is that seasonal factors are now being calculated for use during the first 6 months of the year, rather than for the entire year, and then are calculated at mid-year for the July-December period. Revisions of historical data continue to be made only at the end of each calendar year. Annual revision of the seasonally adjusted payroll data in tables 11, 13, 16, and 18 was last introduced in the November 1979 issue of the *Review*. New seasonal factors for productivity data in tables 33 and 34 are usually introduced in the September issue. Seasonally adjusted indexes and percent changes from month to month and from quarter to quarter are published for numerous Consumer and Producer Price Index series. However, seasonally adjusted indexes are not published for the U.S. average All Items CPI. Only seasonally adjusted percent changes are available for this series.

Adjustments for price changes. Some data are adjusted to eliminate the effect of changes in price. These adjustments are made by dividing current dollar values by the Consumer Price Index or the appropriate component of the index, then multiplying by 100. For example, given a current hourly wage rate of $3 and a current price index number of 150, where 1967 = 100, the hourly rate expressed in 1967 dollars is $2 ($3/150 × 100 = $2). The resulting values are described as "real," "constant," or "1967" dollars.

Availability of information. Data that supplement the tables in this section are published by the Bureau of Labor Statistics in a variety of sources. Press releases provide the latest statistical information published by the Bureau; the major recurring releases are published according to the schedule given below. The *Handbook of Labor Statistics 1978*, Bulletin 2000, provides more detailed data and greater historical coverage for most of the statistical series presented in the *Monthly Labor Review*. More information from the household and establishment surveys is provided in *Employment and Earnings*, a monthly publication of the Bureau, and in two comprehensive data books issued annually—*Employment and Earnings, United States*, and *Employment and Earnings, States and Areas*. More detailed information on wages and other aspects of collective bargaining appears in the monthly periodical, *Current Wage Developments*. More detailed price information is published each month in the periodicals, the *CPI Detailed Report* and *Producer Prices and Price Indexes*.

Symbols

p = preliminary. To improve the timeliness of some series, preliminary figures are issued based on representative but incomplete returns.
r = revised. Generally this revision reflects the availability of later data but may also reflect other adjustments.
n.e.c. = not elsewhere classified.

Schedule of release dates for major BLS statistical series

Title and frequency (monthly except where indicated)	Release date	Period covered	Release date	Period covered	MLR table number
Employment situation	March 7	February	April 4	March	1–11
Producer Price Indexes	March 7	February	April 4	March	26–30
Consumer Price Index	March 25	February	April 22	March	22–25
Real earnings	March 25	February	April 22	March	14–20
Productivity and costs:					
Nonfarm business and manufacturing	....	....	April 25	1st quarter	31–34
Work stoppages	March 28	February	April 28	March	37
Labor turnover in manufacturing	March 31	February	April 30	March	12–13

EMPLOYMENT DATA FROM THE HOUSEHOLD SURVEY

EMPLOYMENT DATA in this section are obtained from the Current Population Survey, a program of personal interviews conducted monthly by the Bureau of the Census for the Bureau of Labor Statistics. The sample consists of about 65,000 households beginning in January 1980, selected to represent the U.S. population 16 years of age and older. Households are interviewed on a rotating basis, so that three-fourths of the sample is the same for any 2 consecutive months.

Definitions

Employed persons are (1) those who worked for pay any time during the week which includes the 12th day of the month or who worked unpaid for 15 hours or more in a family-operated enterprise and (2) those who were temporarily absent from their regular jobs because of illness, vacation, industrial dispute, or similar reasons. A person working at more than one job is counted only in the job at which he or she worked the greatest number of hours.

Unemployed persons are those who did not work during the survey week, but were available for work except for temporary illness and had looked for jobs within the preceding 4 weeks. Persons who did not look for work because they were on layoff or waiting to start new jobs within the next 30 days are also counted among the unemployed. The **unemployment rate** represents the number unemployed as a percent of the civilian labor force.

The **civilian labor force** consists of all employed or unemployed persons in the civilian noninstitutional population; the **total labor force** includes military personnel. Persons **not in the labor force** are those not classified as employed or unemployed; this group includes persons retired, those engaged in their own housework, those not working while attending school, those unable to work because of longterm illness, those discouraged from seeking work because of personal or job market factors, and those who are voluntarily idle. The **noninstitutional population** comprises all persons 16 years of age and older who are not inmates of penal or mental institutions, sanitariums, or homes for the aged, infirm, or needy.

Full-time workers are those employed at least 35 hours a week; **part-time workers** are those who work fewer hours. Workers on part-time schedules for economic reasons (such as slack work, terminating or starting a job during the week, material shortages, or inability to find full-time work) are among those counted as being on full-time status, under the assumption that they would be working full time if conditions permitted. The survey classifies unemployed persons in full-time or part-time status by their reported preferences for full-time or part-time work.

Notes on the data

From time to time, and especially after a decennial census, adjustments are made in the Current Population Survey figures to correct for estimating errors during the preceding years. These adjustments affect the comparability of historical data presented in table 1. A description of these adjustments and their effect on the various data series appear in the Explanatory Notes of *Employment and Earnings*.

Data in tables 2–7 are seasonally adjusted, based on the seasonal experience through December 1979.

1. Employment status of the noninstitutional population, 16 years and over, selected years, 1950–79

[Numbers in thousands]

Year	Total non-institutional population	Total labor force		Civilian labor force						Not in labor force
					Employed			Unemployed		
		Number	Percent of population	Total	Total	Agriculture	Nonagricultural industries	Number	Percent of labor force	
1950	106,645	63,858	59.9	62,208	58,918	7,160	51,758	3,288	5.3	42,787

NOTE: The data in these tables have been revised to reflect seasonal experience through 1979. See pages 74–5.

EMPLOYMENT, HOURS, AND EARNINGS DATA FROM ESTABLISHMENT SURVEYS

EMPLOYMENT, HOURS, AND EARNINGS DATA in this section are compiled from payroll records reported monthly on a voluntary basis to the Bureau of Labor Statistics and its cooperating State agencies by 162,000 establishments representing all industries except agriculture. In most industries, the sampling probabilities are based on the size of the establishment; most large establishments are therefore in the sample. (An establishment is not necessarily a firm; it may be a branch plant, for example, or warehouse.) Self-employed persons and others not on a regular civilian payroll are outside the scope of the survey because they are excluded from establishment records. This largely accounts for the difference in employment figures between the household and establishment surveys.

LABOR TURNOVER DATA in this section are compiled from personnel records reported monthly on a voluntary basis to the Bureau of Labor Statistics and its cooperating State agencies. A sample of 40,000 establishments represents all industries in the manufacturing and mining sectors of the economy.

Definitions

Employed persons are all persons who received pay (including holiday and sick pay) for any part of the payroll period including the 12th of the month. Persons holding more than one job (about 5 percent of all persons in the labor force) are counted in each establishment which reports them.

Production workers in manufacturing include blue-collar worker supervisors and all nonsupervisory workers closely associated with production operations. Those workers mentioned in tables 14–20 include production workers in manufacturing and mining; construction workers in construction; and nonsupervisory workers in transportation and public utilities, in wholesale and retail trade, in finance, insurance, and real estate, and in service industries. These groups account for about four-fifths of the total employment on private nonagricultural payrolls.

Earnings are the payments production or nonsupervisory workers receive during the survey period, including premium pay for overtime or late-shift work but excluding irregular bonuses and other special payments. **Real earnings** are earnings adjusted to eliminate the effects of price change. The **Hourly Earnings Index** is calculated from average hourly earnings data adjusted to exclude the effects of two types of changes that are unrelated to underlying wage-rate developments: fluctuations in overtime premiums in manufacturing (the only sector for which overtime data are available) and the effects of changes and seasonal factors in the proportion of workers in high-wage and low-wage industries. **Spendable earnings** are earnings from which estimated social security and Federal income taxes have been deducted. The Bureau of Labor Statistics computes spendable earnings from gross weekly earnings for only two illustrative cases: (1) a worker with no dependents and (2) a married worker with three dependents.

Hours represent the average weekly hours of production or nonsupervisory workers for which pay was received and are different from standard or scheduled hours. **Overtime hours** represent the portion of gross average weekly hours which were in excess of regular hours and for which overtime premiums were paid.

Labor turnover is the movement of all wage and salary workers from one employment status to another. **Accession rates** indicate the average number of persons added to a payroll in a given period per 100 employees; **separation rates** indicate the average number dropped from a payroll per 100 employees. Although month-to-month changes in employment can be calculated from the labor turnover data, the results are not comparable with employment data from the employment and payroll survey. The labor turnover survey measures changes during the calendar month while the employment and payroll survey measures changes from midmonth to midmonth.

Notes on the data

Establishment data collected by the Bureau of Labor Statistics are periodically adjusted to comprehensive counts of employment (called "benchmarks"). The latest complete adjustment was made with the release of September 1979 data, published in the November 1979 issue of the *Review*. Consequently, data published in the *Review* prior to that issue are not necessarily comparable to current data. Complete comparable historical unadjusted and seasonally adjusted data are published in a Supplement to Employment and Earnings (unadjusted data from April 1977 through June 1979 and seasonally adjusted data from January 1974 through June 1979) and in *Employment and Earnings, United States, 1909–78*, BLS Bulletin 1312–11 (for prior periods).

Data on recalls were shown for the first time in tables 12 and 13 in the January 1978 issue of the *Review*. For a detailed discussion of the recalls series, along with historical data, see "New Series on Recalls from the Labor Turnover Survey," *Employment and Earnings*, December 1977, pp. 10–19.

A comprehensive discussion of the differences between household and establishment data on employment appears in Gloria P. Green, "Comparing employment estimates from household and payroll surveys," *Monthly Labor Review*, December 1969, pp. 9–20. See also *BLS Handbook of Methods for Surveys and Studies*, Bulletin 1910 (Bureau of Labor Statistics, 1976).

The formulas used to construct the spendable average weekly earnings series reflect the latest provisions of the Federal income tax and social security tax laws. For the spendable average weekly earnings formulas for the years 1977–79, see *Employment and Earnings*, September 1979, pp. 6–8. Beginning with data for January 1978, real earnings data are adjusted using the revised Consumer Price Index for Urban Wage Earners and Clerical Workers. Data prior to January 1978 are based on the unrevised Consumer Price Index for Urban Wage Earners and Clerical Workers.

8. Employment by industry, 1949–78

NOTE: The earnings expressed in 1967 dollars have been adjusted for changes in price level as measured by the Bureau's Consumer Price Index for Urban Wage Earners and Clerical Workers (revised). These series are described in "The Spendable Earnings Series: A Technical Note on its Calculation", Employment and Earnings and Monthly Report on the Labor Force, February 1969, pp. 6 – 13, See also "Spendable Earnings Formulas, 1977 – 79" Employment and Earnings, September 1979, pp. 6 – 8.

UNEMPLOYMENT INSURANCE DATA

UNEMPLOYMENT INSURANCE DATA are compiled monthly by the Employment and Training Administration of the U.S. Department of Labor from records of State and Federal unemployment insurance claims filed and benefits paid. Railroad unemployment insurance data are prepared by the U.S. Railroad Retirement Board.

Definitions

Data for **all programs** represent an unduplicated count of insured unemployment under the State, Ex-Servicemen, and UCFE programs, and the Railroad Insurance Act.

Under both State and Federal unemployment insurance programs for civilian employees, insured workers must report the completion of at least 1 week of unemployment before they are defined as unemployed. Persons not covered by unemployment insurance (about one-third of the labor force) and those who have exhausted or not yet earned benefit rights are excluded from the scope of the survey. **Initial claims** are notices filed by persons in unemployment insurance programs to indicate they are out of work and wish to begin receiving compensation. A claimant who continued to be unemployed a full week is then counted in the insured unemployment figure. The **rate of insured unemployment** expresses the number of insured unemployed as a percent of the average insured employment in a 12-month period.

An **application** for benefits is filed by a railroad worker at the beginning of his first period of unemployment in a benefit year; no application is required for subsequent periods in the same year. **Number of payments** are payments made in 14-day registration periods. The **average amount of benefit payment** is an average for all compensable periods, not adjusted for recovery of overpayments or settlement of underpayments. However, **total benefits paid** have been adjusted.

21. Unemployment insurance and employment service operations

[All items except average benefits amounts are in thousands]

---

[1] Initial claims and State insured unemployment include data under the program for Puerto Rican sugarcane workers.

[2] Includes interstate claims for the Virgin Islands. Excludes transition claims under State programs.

[3] Excludes data on claims and payments made jointly with other programs.

[4] Includes the Virgin Islands. Excludes data on claims and payments made jointly with State programs.

[5] Cumulative total for fiscal year (October 1 – September 30).

NOTE: Data for Puerto Rico included. Dashes indicate data not available.

PRICE DATA

PRICE DATA are gathered by the Bureau of Labor Statistics from retail and primary markets in the United States. Price indexes are given in relation to a base period (1967 = 100, unless otherwise noted).

Definitions

The Consumer Price Index is a monthly statistical measure of the average change in prices in a fixed market basket of goods and services. Effective with the January 1978 index, the Bureau of Labor Statistics began publishing CPI's for two groups of the population. One index, a new CPI for All Urban Consumers, covers 80 percent of the total noninstitutional population; and the other index, a revised CPI for Urban Wage Earners and Clerical Workers, covers about half the new index population. The All Urban Consumers index includes, in addition to wage earners and clerical workers, professional, managerial, and technical workers, the self-employed, short-term workers, the unemployed, retirees, and others not in the labor force.

The CPI is based on prices of food, clothing, shelter, fuel, drugs, transportation fares, doctor's and dentist's fees, and other goods and services that people buy for day-to-day living. The quantity and quality of these items is kept essentially unchanged between major revisions so that only price changes will be measured. Prices are collected from over 18,000 tenants, 24,000 retail establishments, and 18,000 housing units for property taxes in 85 urban areas across the country. All taxes directly associated with the purchase and use of items are included in the index. Because the CPI's are based on the expenditures of two population groups in 1972–73, they may not accurately reflect the experience of individual families and single persons with different buying habits.

Though the CPI is often called the "Cost-of-Living Index," it measures only price change, which is just one of several important factors affecting living costs. Area indexes do not measure differences in the level of prices among cities. They only measure the average change in prices for each area since the base period.

Producer Price Indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. The sample used for calculating these indexes contains about 2,800 commodities and about 10,000 quotations per month selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer Price Indexes can be organized by stage of processing or by commodity. The stage of processing structure organizes products by degree of fabrication (that is, finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

To the extent possible, prices used in calculating Producer Price Indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Most prices are obtained directly from producing companies on a voluntary and confidential basis. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating Producer Price Indexes, price changes for the various commodities are averaged together with implicit quantity weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage of processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings.

Price indexes for the output of selected SIC industries measure average price changes in commodities produced by particular industries, as defined in the *Standard Industrial Classification Manual 1972* (Washington, U.S. Office of Management and Budget, 1972). These indexes are derived from several price series, combined to match the economic activity of the specified industry and weighted by the value of shipments in the industry. They use data from comprehensive industrial censuses conducted by the U.S. Bureau of the Census and the U.S. Department of Agriculture.

Notes on the data

Beginning with the May 1978 issue of the *Review*, regional CPI's cross classified by population size, were introduced. These indexes will enable users in local areas for which an index is not published to get a better approximation of the CPI for their area by using the appropriate population size class measure for their region. The cross-classified indexes will be published bimonthly. (See table 24.)

For further details about the new and the revised indexes and a comparison of various aspects of these indexes with the old unrevised CPI, see *Facts About the Revised Consumer Price Index*, a pamphlet in the Consumer Price Index Revision 1978 series. See also *The Consumer Price Index: Concepts and Content Over the Years*. Report 517, revised edition (Bureau of Labor Statistics, May 1978).

For interarea comparisons of living costs at three hypothetical standards of living, see the family budget data published in the *Handbook of Labor Statistics, 1977*, Bulletin 1966 (Bureau of Labor Statistics, 1977), tables 122–133. Additional data and analysis on price changes are provided in the *CPI Detailed Report* and *Producer Prices and Price Indexes*, both monthly publications of the Bureau.

As of January 1976, the Wholesale Price Index (as it was then called) incorporated a revised weighting structure reflecting 1972 values of shipments. From January 1967 through December 1975, 1963 values of shipments were used as weights.

For a discussion of the general method of computing consumer, producer, and industry price indexes, see *BLS Handbook of Methods for Surveys and Studies*, Bulletin 1910 (Bureau of Labor Statistics, 1976), chapters 13–15. See also John F. Early, "Improving the measurement of producer price change," *Monthly Labor Review*, April 1978, pp. 7–15. For industry prices, see also Bennett R. Moss, "Industry and Sector Price Indexes," *Monthly Labor Review*, August 1965, pp. 974–82.

[1] Prices for natural gas are lagged 1 month.

[2] Includes only domestic production.

[3] Most prices for refined petroleum products are lagged 1 month.

[4] Some prices for industrial chemicals are lagged 1 month.

[5] Not available.

NOTE: Data for September 1979 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication.

28. Producer Price Indexes, for special commodity groupings

[1967 = 100 unless otherwise specified]

Commodity grouping	Annual average 1978	1979												1980
		Jan.	Feb.	Mar.	Apr.	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.	Jan.
All commodities — less farm products	208.4	219.3	222.0	224.7	228.0	230.1	232.0	235.4	237.5	241.4	244.9	246.7	249.2	219.3

NOTE: Data for September 1979 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication.

PRODUCTIVITY DATA

PRODUCTIVITY DATA are compiled by the Bureau of Labor Statistics from establishment data and from estimates of compensation and output supplied by the U.S. Department of Commerce and the Federal Reserve Board.

Definitions

Output is the constant dollar gross domestic product produced in a given period. Indexes of **output per hour of labor input,** or labor productivity, measure the value of goods and services produced per hour of labor. **Compensation per hour** includes wages and salaries of employees plus employers' contributions for social insurance and private benefit plans. The data also include an estimate of wages, salaries, and supplementary payments for the self-employed, except for nonfinancial corporations, in which there are no self-employed. **Real compensation per hour** is compensation per hour adjusted by the Consumer Price Index for All Urban Consumers.

Unit labor cost measures the labor compensation cost required to produce one unit of output and is derived by dividing compensation by output. **Unit nonlabor payments** include profits, depreciation, interest, and indirect taxes per unit of output. They are computed by subtracting compensation of all persons from the current dollar gross domestic product and dividing by output. In these tables, **Unit nonlabor costs** contain all the components of unit nonlabor payments except unit profits. **Unit profits** include corporate profits and inventory valuation adjustments per unit of output.

The **implicit price deflator** is derived by dividing the current dollar estimate of gross product by the constant dollar estimate, making the deflator, in effect, a price index for gross product of the sector reported.

The use of the term "man-hours" to identify the labor component of productivity and costs, in tables 31 through 34, has been discontinued. **Hours of all persons** is now used to describe the labor input of payroll workers, self-employed persons, and unpaid family workers. **Output per all-employee hour** is now used to describe labor productivity in nonfinancial corporations where there are no self-employed.

Notes on the data

In the private business sector and the nonfarm business sector, the basis for the output measure employed in the computation of output per hour is Gross Domestic Product rather than Gross National Product. Computation of hours includes estimates of nonfarm and farm proprietor hours.

Output data are supplied by the Bureau of Economic Analysis, U.S. Department of Commerce, and the Federal Reserve Board. Quarterly manufacturing output indexes are adjusted by the Bureau of Labor Statistics to annual estimates of output (gross product originating) from the Bureau of Economic Analysis. Compensation and hours data are from the Bureau of Economic Analysis and the Bureau of Labor Statistics.

Beginning with the September 1976 issue of the *Review,* tables 31–34 were revised to reflect changeover to the new series—private business sector and nonfarm business sector—which differ from the previously published total private economy and nonfarm sector in that output imputed for owner-occupied dwellings and the household and institutions sectors, as well as the statistical discrepancy, are omitted. For a detailed explanation, see J. R. Norsworthy and L. J. Fulco, "New sector definitions for productivity series," *Monthly Labor Review,* October 1976, pages 40–42.

LABOR-MANAGEMENT DATA

MAJOR COLLECTIVE BARGAINING DATA are obtained from contracts on file at the Bureau of Labor Statistics, direct contact with the parties, and from secondary sources. Additional detail is published in *Current Wage Developments*, a monthly periodical of the Bureau. Data on work stoppages are based on confidential responses to questionnaires mailed by the Bureau of Labor Statistics to parties involved in work stoppages. Stoppages initially come to the attention of the Bureau from reports of Federal and State mediation agencies, newspapers, and union and industry publications.

Definitions

Data on wage changes apply to private nonfarm industry agreements covering 1,000 workers or more. Data on wage and benefit changes *combined* apply only to those agreements covering 5,000 workers or more. **First-year wage settlements** refer to pay changes going into effect within the first 12 months after the effective date of the agreement. **Changes over the life of the agreement** refer to total agreed upon settlements (exclusive of potential cost-of-living escalator adjustments) expressed at an average annual rate. **Wage-rate changes** are expressed as a percent of straight-time hourly earnings, while **wage and benefit changes** are expressed as a percent of total compensation.

Effective wage-rate adjustments going into effect in major bargaining units measure changes actually placed into effect during the reference period, whether the result of a newly negotiated increase, a deferred increase negotiated in an earlier year, or as a result of a cost-of-living escalator adjustment. Average adjustments are affected by workers receiving no adjustment, as well as by those receiving increases or decreases.

Work stoppages include all known strikes or lockouts involving six workers or more and lasting a full shift or longer. Data cover all workers idle one shift or more in establishments directly involved in a stoppage. They do not measure the indirect or secondary effect on other establishments whose employees are idle owing to material or service shortages.

35. Wage and benefit settlements in major collective bargaining units, 1975 to date
[In percent]

Sector and measure	Annual average					Quarterly average						
						1978			1979

How to order BLS publications

PERIODICALS

Order from (and make checks payable to) Superintendent of Documents, Washington, D.C. 20402. For foreign subscriptions, add 25 percent.

Monthly Labor Review. The oldest and most authoritative government research journal in economics and the social sciences. Current statistics, analysis, developments in industrial relations, court decisions, book reviews. $18 a year, single copy, $2.50.

Employment and Earnings. A comprehensive monthly report on employment, hours, earnings, and labor turnover by industry, area, occupation, et cetera $22 a year, single copy $2.75.

Occupational Outlook Quarterly. A popular periodical designed to help high school students and guidance counselors assess career opportunities. $6 for four issues, single copy $1.75.

Current Wage Developments. A monthly report about collective bargaining settlements and unilateral management decisions about wages and benefits; statistical summaries. $12 a year, single copy $1.35.

Producer Prices and Price Indexes. A comprehensive monthly report on price movements of both farm and industrial commodities, by industry and stage of processing. $17 a year, single copy $2.25.

CPI Detailed Report. A monthly periodical featuring detailed data and charts on the Consumer Price Index. $15 a year, single copy $2.25.

PRESS RELEASES

The Bureau's statistical series are made available to news media through press releases issued in Washington. Many of the releases also are available to the public upon request. Write: Bureau of Labor Statistics, Washington, D.C. 20212.

Regional. Each of the Bureau's eight regional offices publishes reports and press releases dealing with regional data. Single copies available free from the issuing regional office.

BULLETINS AND HANDBOOKS

About 140 bulletins and handbooks published each year are for sale by regional offices of the Bureau of Labor Statistics (see inside front cover) and by the Superintendent of Documents. Washington, D.C. 20402. Make checks payable to the Superintendent of Documents. Among the bulletins and handbooks currently in print are these:

Occupational Outlook Handbook, 1978–79 Edition. Bulletin 1955. A useful resource supplying valuable assistance to all persons seeking satisfying and productive employment. $8, paperback; $11 hard cover.

BLS Handbook of Labor Statistics 1978. Bulletin 2000. A 604-page volume of historical data on the major BLS statistical series. $9.50.

Handbook of Methods. Bulletin 1910. Brief technical account of each major statistical program of the Bureau of Labor Statistics. $3.50.

BLS Measures of Compensation. Bulletin 1941. An introduction to the various measures of employee compensation; describes each series, the manner in which it is developed, its uses and limitations. $2.75.

Occupational Projections and Training Data. Bulletin 2020. Presents both general and detailed information on the relationship between occupational requirements and training needs. (Updates Bulletin 1918 published in 1976.) $3.25.

Technological Change and its Labor Impact in Five Energy Industries. Bulletin 2005. A 64-page study appraising major technological change and discussing the impact of these changes on productivity and occupations over the next 5 to 10 years. $2.40.

BLS Publications, 1972–77. Bulletin 1990. A numerical listing and subject index of bulletins and reports issued by the Bureau from 1972 through 1977, supplementing Bulletin 1749, covering 1886–1971. $1.80.

International Comparisons of Unemployment. Bulletin 1979. Brings together all of the Bureau's work on international unemployment comparisons. Describes the methods of adjusting foreign unemployment rates in 8 countries to U.S. concepts. $3.50.

Productivity Indexes for Selected Industries, 1979 Edition. Bulletin 2054. A 190-page report of indexes of output, employment, and employee hours in selected industries from 1954 to 1978. This edition contains measures for three industries previously not covered, as well as components of previously published measures in 10 industries. $5.50.

Profiles of Occupational Pay: A Chartbook. Bulletin 2037. A graphic illustration of some of the factors that affect workers' earnings. This three-part presentation looks at wage variations among and within occupations and portrays characteristics of high- and low-paying urban areas and manufacturing industries. $3.50.

REPORTS AND PAMPHLETS

Single copies available free from the BLS regional offices or from the Bureau of Labor Statistics, U.S. Department of Labor, Washington, D.C. 20212.

How the Government Measures Unemployment. Report 505. A concise report providing a background for appraising developments in the area of unemployment.

Directory of BLS Studies in Industrial Relations 1960–78. Report 550. A listing of studies prepared by the Division of Industrial Relations as part of the Bureau's regular program of data collection and analysis in the field of industrial relations.

Bulletin 2000

The 1978 edition of the Handbook of Labor Statistics makes available in one 620-page volume the major series produced by the Bureau of Labor Statistics. Each table is complete historically, beginning with the earliest reliable and consistent data and running through calendar year 1977. The volume includes index and technical notes.

Tables include:

Labor force
Employment
Unemployment
Hours
Productivity and unit labor costs
Compensation
Prices and living conditions
Unions and industrial relations
Foreign labor statistics
General economic data

MONTHLY LABOR REVIEW

APRIL 1980
VOLUME 103, NUMBER 4

Henry Lowenstern, Editor-in-Chief
Robert W. Fisher, Executive Editor

Peter Henle, Paul Ryscavage 3 **The distribution of earnings among men and women, 1958–77**
The trend toward an increasing disparity in earnings among men appeared to slow in recent years, while the more unequal distribution among women remained stable

Robert L. Stein 11 **National Commission's recommendations on labor force statistics**
Congressionally mandated panel finds the U.S. system of statistics on employment fundamentally sound but recommends significant expansions and refinements of data

Joseph P. Goldberg 22 **Frances Perkins, Isador Lubin, and the Bureau of Labor Statistics**
As head of BLS, Isador Lubin worked closely with Secretary of Labor Frances Perkins to meet the urgent need for data on Depression-era employment and unemployment

Henry P. Guzda 31 **Frances Perkins' interest in a new deal for blacks**
The black-oriented programs of the Nation's first female Cabinet member may seem modest by today's standards, but she made the welfare of blacks a priority of her agency

Virginia A. Chupp 36 **Changes in unemployment insurance legislation during 1979**
Concern for financing of unemployment insurance payments was evident last year; changes generally involved extending disqualification periods and restricting eligibility

Labor Month In Review

FRANCES PERKINS. The 100th anniversary of the birth of Frances Perkins is being marked this month by the issuance of a postage stamp bearing her likeness and by the naming in her honor of the building housing the U.S. Department of Labor. Several articles and other features in this issue of the *Monthly Labor Review* describe the life and work of Frances Perkins. Her important contributions also are recounted in a Labor Department booklet marking the dedication of the Frances Perkins Building. Excerpts:

Questions for FDR. Before Frances Perkins would accept the Cabinet appointment as Secretary of Labor, she told President-elect Franklin Delano Roosevelt, "I don't want to say yes to you unless you know what I'd like to do and are willing to have me go ahead and try."

She then read Roosevelt her list. It contained much of what would become the New Deal's most important social welfare and labor legislation: direct Federal aid to the States for unemployment relief, public works, maximum hours, minimum wages, child labor laws, unemployment insurance, social security, and a revitalized public employment service. "Are you sure you want these things done?" she asked. "Because you don't want me for Secretary of Labor if you don't."

Roosevelt never hesitated. He was convinced that the capable and strong-minded woman in his study was the most qualified person for the job. "Yes," he said. "I'll back you." With that, Perkins immediately accepted the post and served as Secretary of Labor the entire 12 years of the Roosevelt Administration. She was the first woman ever to serve as a Cabinet member and she served longer than any other Secretary of Labor.

Social security. The Social Security Act of 1935 was probably the most enduring contribution Perkins made as a Government official. As a member of the Committee on Economic Security, she worked tirelessly to create a practical social security program which could both pass the Congress and help the people. She made hundreds of speeches supporting social security. Its enactment, on August 14, 1935, helped change the economic and social structure of American life. Her belief that working people had a right to benefits during unemployment and in their old age was made the law of the land by this act. Perkins' determination helped workers secure a more equitable place on the social scale. Her leadership, and the dedicated work of many others, helped remove the threat of starvation, eviction, and destitution from every worker's doorstep.

Fair labor standards. If social security was Frances Perkins' pride, the Fair Labor Standards Act must have been her joy. She had long advocated minimum wage and maximum hour legislation. The collapse of labor standards during the Depression made some type of Government action imperative. Many among Roosevelt's advisers were uncertain of the constitutionality of Federal labor standards legislation. To lay the groundwork for Federal standards she believed inevitable, Perkins instructed the Labor Department to work with State governments to create a body of consistent laws and standards. She set up a Division of Labor Standards and was the first Labor Secretary to show real interest and concern for State labor agencies. She always tried to attend meetings with state representatives and considered these sessions very useful in developing workers' compensation and safety and health standards.

During his 1936 campaign for reelection, Roosevelt promised to support a Federal labor standards bill. The measure passed the Senate but died in the House Rules Committee. Perkins and Roosevelt would not let it rest in peace. Compromises were made and pressure was applied. The Fair Labor Standards Act.finally became law on June 25, 1938.

The role of States. The social legislation of the 1930's forever changed the position of the American worker in society. While the Federal Government was often instrumental in creating these laws and indispensable for putting them into operation, Perkins often advocated more involvement for the individual States. She believed that programs such as unemployment insurance should be administered by a Federal-State system. At the National Conference for Labor Legislation in February 1934, she said: "The fundamental power to make regulations with regard to welfare . . . lies with the sovereign States." While many New Dealers have been seen as "big government" people, Perkins rarely favored the Federal Government dictating or making policy for the States. The closer decisionmaking was to the people, the better Perkins liked it.

The Perkins legacy. Perkins, indeed, had become an important historical figure. Yet with all her accomplishments, she never lost the basic qualities that made her an extraordinary person: her courage, her vibrant personality, her gift for friendship, her sense of propriety and privacy, and her deep religious spirit. These qualities formed the core ot her character and they touched everyone she knew as well as the millions of people unknown to her for whom she worked throughout her life.

The distribution of earned income among men and women, 1958–77

The trend toward greater earnings inequality for men continued, but appeared to slow in recent years; the more unequal distribution for women remained stable, probably reflecting limited occupational advances

PETER HENLE AND PAUL RYSCAVAGE

The distribution of income continues to be a lively topic for public policy as well as academic debate. While few, if any, officials have embraced income redistribution as a goal of public policy, many legislative and administrative measures have, in fact, altered income distribution. The extent of such redistribution often becomes a major factor underlying the resolution of tax, welfare, and other economic policy questions. As one example, the 1977 congressional rejection of practically all President Carter's proposals for tax reform reflected a quite different attitude toward income distribution than the attitudes underlying the antipoverty programs of the 1960's.

A 1972 article explored the distribution of earned income (wages, salaries, and self-employment earnings) for men during 1958–70.[1] That study found "a slow but persistent trend toward greater inequality" both for all male earners and for those working full time year round. Various possible explanations for such a trend were discussed, including the changing age composition of the population, the changing structural characteristics of jobs, and differential changes in the rates of compensation.

The current effort extends the earlier work in several ways. First, the data have been carried forward to 1977. This permits a broader perspective to test the trends identified from 1958–70 data. Second, data for women are included for the first time, allowing a comparison of earnings distribution trends by sex. And third, more recent contributions to the literature are reviewed to determine whether they have added to the earlier analysis.[2]

As in the earlier case, this study utilizes the Gini index as a shorthand method of describing the shape of earnings distribution.[3] Although it may have some statistical limitations, it still seems a useful way to identify the degree of equality at any one time and track changes in distribution over several years. The primary data used here are annual earnings reported to the Census Bureau by members of a nationwide sample of households (Current Population Survey). The current data incorporate various improvements in methodology, with the result that the 1958–70 Gini indexes utilized in the earlier article have been revised.[4] Values are for money income only, and no effort was made to include any estimate for fringe benefits not reflected in earnings, such as employer expenditures for health, welfare, and retirement plans. The article will focus first on the new and revised data for men; a discussion of the new data for women will follow.

Earnings distribution of men

The basic structure of the earnings distribution noted in the 1972 article still holds. For example, the distribu-

---

Peter Henle recently retired as Deputy Assistant Secretary for Policy, Evaluation, and Research, U.S. Department of Labor. Paul Ryscavage is an economist in the Office of Current Employment Analysis, Bureau of Labor Statistics. Views expressed in this article are not necessarily those of the Department of Labor.

tion of wages and salaries is more equal than the distribution of all reported earnings. This follows from the fact that the self-employed include major concentrations at both the low and the high end of the distribution—low-earning proprietors of small retail and service establishments and high-earning professionals and businessmen. In a somewhat similar way, the distribution for year-round full-time workers is more equal than the distribution for all workers, because the inclusion of the part-time and part-year workers adds a large group of low-income earners to the distribution.

The "slow but persistent" trend toward inequality, previously noted for the years 1958–70, is still evident, although a 20-year perspective yields somewhat different insights. As shown in table 1, the trend towards inequality for the most inclusive series (all earners) continued steadily until 1977. A similar trend is evident for all male wage and salary workers. For both series, the 1968–73 period appears to show the greatest shift toward inequality, with the trend somewhat less marked before and after this period. For year-round full-time workers, the figures indicate either no trend at all (all earners) or a slightly more modest trend toward inequality (wage and salary workers).

These data, of course, pertain to broad aggregates and all classes of earners. Perhaps more revealing are the data for occupational and industry groups, shown in table 2. The trend toward inequality among male workers in specific occupations and industries is even more evident. To assist in this analysis, a simple time series regression of the annual Gini indexes was utilized; the results are shown in tables 3 and 4.

Table 1. Gini indexes of all earnings and wages and salaries among men, 1958–77

Item and year	All earners		Wage and salary earners	
	Total	Year-round full-time	Total	Year-round full-time
Workers, 1977 (in thousands)	61,704	39,263	47,473	34,128
Median income, 1977	$11,037	$14,626	$12,439	$14,902

1973	.427	.314	.360	.283
1974	.429	.319	.359	.286
1974[r]	.433	.315	.361	.281
1975	.434	.311	.367	.282
1976	.438	.317	.371	.284
1977	.439	.318	.374	.287

[1] Gini indexes for year-round full-time wage and salary workers, 1958–66, appeared in the earlier article (see text footnote 1), and were not recomputed when changes were made in the way the Gini indexes were calculated by the Census Bureau (see text footnote 4 for information on these changes).

[r] = revised. The 1974 income data were revised because of changes in the procedures used in collecting and processing the data. See text footnote 4 for more details.

NOTE: Data on earnings apply to all individuals with earnings in the specified year. Data on wages and salaries apply to all individuals employed in March of the following year who received wages or salaries in the specified year.

Of the 10 major occupational groups, eight (managers and farm laborers are the exception) show a distinct trend toward inequality among all earners during 1958–77. Among year-round full-time workers, managers and farm laborers show a trend towards equality, professional workers and nonfarm laborers show an uncertain trend, but all the remaining occupational groups show a trend towards inequality. Increasing inequality is pronounced among blue-collar groups such as craftworkers and operatives. Clerical and sales (white-collar) occupations show an equally distinct trend toward inequality since 1958, but for clerical workers the annual data indicate less change during recent years.

When the data are grouped by industry, the results are similar; but industry data are available only for wage and salary workers. Moreover, for year-round full-time workers, data are available only from 1967, although these data were viewed along with the 1958–70 data available for the earlier article (based on an allocation method no longer utilized by the Census Bureau).

As shown in table 4, industry data for all wage and salary earners also display a definite trend toward inequality. The trend is especially marked for construction, manufacturing, transportation, trade, finance, most of the service industries, and public administration. As expected, data for all workers show a more definitive trend than the results for year-round full-time workers. Focusing on the latter group, both agriculture and mining show a trend toward equality. For the transportation, retail trade, and finance groups and for public administration, a statistically significant trend toward inequality is clear, but for the remaining industries little trend is indicated.

Earlier factors less significant

The 1972 article reviewed various postwar developments that may have contributed to the trend towards inequality of earnings. Three types of factors were examined: changes in the personal characteristics of earners that might affect their earnings ability, chiefly age and schooling; changes in the characteristics of jobs that might affect the earnings ability of the jobholders; and changes in the rates of compensation in various occupations and industries that might affect differently jobs at various points in the earnings distribution.

The earlier analysis identified four specific developments that may have contributed to the trend towards inequality: the growing importance of voluntary part-

Table 2. Gini indexes of earnings among men, by occupation (all earners) and industry (wage and salary earners), selected years

[r] = revised. The 1974 income data were revised because of changes in the procedures used in collecting and processing the data. See text footnote 4 for more details.

time work; the increasing flow of young people into the labor force, many of them with low earnings; the changing occupational structure—more specifically the growing importance of highly paid professional and managerial personnel; and the pattern of increases in earnings which, in many instances, has meant higher increases in rates of pay for the higher earning occupations.

The result of these four developments in the 1958–70 period, it was concluded, was an increased proportion of earners at the lowest and highest end of the income scale.

These developments continued to operate during the 1970's, but in several respects it would appear that they were less significant, particularly in more recent years:

1. The rate at which young people have entered the labor market has slowed dramatically, reflecting the reduction in birth rates which took place beginning in the late 1950's. From 1958 to 1968, the number of young men age 16 to 19 in the civilian labor force increased at an annual rate of 4.2 percent. During 1968–73, the rate rose to 4.9 percent before dropping to 1.7 percent in the 1973–77 period.

2. The increase in voluntary part-time earners among men has also slowed considerably. From 1963 (the earliest year for which data are available) to 1973, the annual rate of increase was 4.3 percent, slowing to 2.1 percent for 1973–77.

3. Changes in the occupational mix from blue collar to white collar also have not occurred with the same rapidity. For example, professional and technical occupations accounted for 10.4 percent of male employees in 1958, increasing substantially to 14.0 percent in 1970, but further increasing to only 14.6 percent in 1977.

Table 3. Regression results of Gini indexes for the earnings of men, by occupation, 1958–77

4. Increases in earnings have also been less dramatic among the higher paid occupations and industries. During 1958–70, the only occupational groups with higher than average earnings increases were both the professional and the managerial groups. During 1970–77, these groups showed below-average increases with higher increases recorded by laborers, semiskilled workers, and salesworkers.

For these reasons, it does not appear surprising that although the trend over the postwar period continues to point toward greater inequality, the movement in that direction has slowed in more recent years.

Special mention might be made of the two industries —agriculture and mining—in which the data for men show a trend toward greater equality. In both cases, special factors seem to be at work. In agriculture, the number of farmers and the farm work force continues to decline slowly, with the drop concentrated among the lower income farm group. Wages for farm laborers have increased quite substantially, with the minimum wage for agricultural workers rising more sharply than the basic minimum, as farm production becomes increasingly mechanized. Thus, it seems likely that the proportion of earners with low annual earnings has declined, helping to provide a more equal distribution.

In mining, which includes not only coal, metal, and nonmetallic mining, but also oil and gas extraction, the prosperity of both the coal mining and the oil and gas segments of the industry has certainly helped to raise earnings of workers in these industries. Because these two prosperous segments account for two-thirds of all mining employees, they may have been significant in producing greater equality of earnings.

[r] = revised. The 1974 income data were revised because of changes in the procedures used in collecting and processing the income data. See text footnote 4 for more details.

NOTE: Data on earnings apply to all individuals with earnings in the specified year. Data on wages and salaries apply to all individuals employed in March of the following year who received wages or salaries in the specified year.

Earnings distribution of women

The earnings distribution of women is significantly different from that of men. There are relatively more low earners and fewer high earners among women, and as a result the median earnings of women (table 5) is substantially lower than the median earnings of men (table 1). Large earnings differences also exist between men and women both as full-time year-round workers and as wage and salary workers.

These earnings differences have been the subject of much research in recent years, and a large literature has developed.[5] Researchers have pointed to a number of factors responsible for the earnings gap: women are more likely than men to work part time because of their childbearing and childrearing responsibilities and because of their greater chances of experiencing unemployment; many women, because of their shorter work histories, lack the necessary job skills, or human capital, to compete successfully with men in the job market; and women are more frequently discriminated against in their attempts to move up the career ladder.

The basic structure of women's earnings distribution is somewhat more unequal than the earnings distribution of men. This greater inequality can be traced to the tendency among women—whether voluntarily or involuntarily—to work only part time and part year. For example, in 1977, nearly 60 percent of all female earners

Table 6. Distribution of all earnings among women, by occupation, 1977

worked less than year round, full time, compared to only 36 percent of all male earners. The greater prevalence of women who work full time and part time, off and on during the year, produces a greater variation in their earnings distribution relative to men.

The earnings of women who work year round in full-time jobs, however, are distributed more equally than the comparable distributions for men. This may occur because full-time year-round female earners tend to be clustered in a few occupations, where the range of earnings is not very great. (For example, in 1977, 39 percent of all female earners working full time, year round were in clerical occupations, and the Gini index for women in this occupation was only .204.)

The degree of earnings inequality varied considerably by the occupations and industries in which women worked. The most unequal earnings distributions for women in 1977 were found in the service, sales, and unskilled occupations (table 6). These occupations are major entry occupations for young women, and earnings are generally low. Occupations with the most equality —more equal than the overall distribution—were the clerical, semiskilled, managerial, and professional occupations. Among the major industries in which female wage and salary workers were employed in 1977, the most unequal earnings distributions were in retail trade, business and personal services, agriculture, forestry, and fisheries, and entertainment and recreation services (table 7). The most equal distributions were observed in manufacturing, finance, insurance, and real estate, transportation, communication, and public utilities, and public administration.

Evenly distributed gains

As shown earlier, there has been a trend toward greater earnings inequality among men during 1958–77, although it weakened to some extent during 1970–77. An obvious question is what was happening to the earnings distributions of women over these years.

In the aggregate, the distribution of women's earnings remained about as unequal in the 1970's as it was in the 1960's and in the late 1950's. (See chart 1.) In

Table 7. Distribution of wage and salary earnings among women, by industry, 1977

Industry	Workers (in thousands)	Median income	Gini index	Percent share of aggregate wage and salary earnings

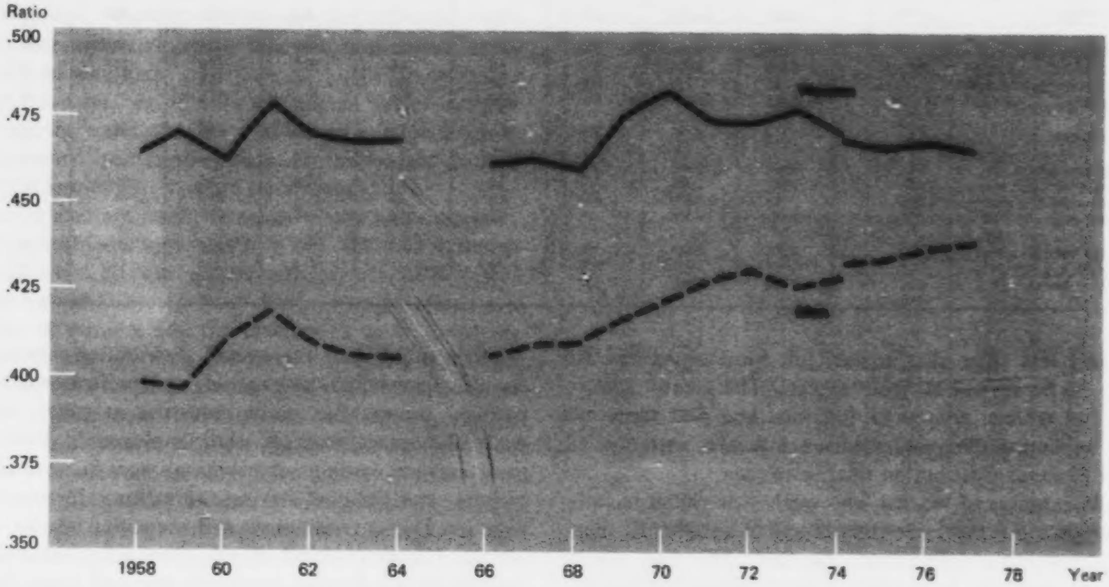
Chart 1. Gini indexes of all male and female earners, 1958-64 and 1966-77



NOTE: Because the Census Bureau revised the income statistics in 1974, the data for 1974-77 are plotted separately (see text footnote 4).

other words, there was no positive or negative trend in the Gini indexes over these 2 decades. (See table 5.) Furthermore, the Gini indexes for those women with steady year-round employment indicate neither a positive nor a negative trend in earnings inequality since 1958.

Among women wage and salary earners, there was some slight evidence of a movement towards greater earnings inequality, especially between 1958 and 1970 (table 5). However, this trend was certainly not as strong as that exhibited by men over the same period. Somewhat more puzzling are the Gini indexes for the full-time year-round wage and salary workers—a series that only begins in 1967. According to these data, there has been a gradual trend towards greater earnings equality between 1967 and 1977, but here, too, the trend is not a very strong one. So, the Gini indexes for these aggregate earnings distributions of women indicate neither strong positive nor negative trends in earnings inequality.

The picture is also mixed when the earnings distributions of women in the various occupations and industries are examined. In the clerical and sales occupations, for example, earnings distributions have tended towards greater inequality, and this applies even in the case of full-time year-round workers (table 8). On the other hand, there is an indication of a movement towards greater equality in the earnings distributions of women working full time, year round in professional, managerial, and service occupations. Among the industries in which women are employed, a movement towards greater earnings inequality was seen in manufacturing, transportation, communication, and public utilities, retail trade, finance, insurance, and real estate, business and personal services, and public administration (table 9). However, the wage and salary earnings distributions for women who work full time, year round in these industries provide little evidence of any trend toward either equality or inequality, except in the professional service industry (toward equality) and in public administration (toward inequality).

How is the lack of any significant trend in earnings inequality for women reconciled with the general trend towards inequality for men? Certainly, the number of young, part-time female workers has grown rapidly in the last 20 years, and an increasing number of women have been employed in higher paying white-collar occupations. These factors should have created greater earnings variation, resulting in greater earnings inequality, just as in the case of men. Although the data indicate a trend toward earnings inequality for certain occupations and industries, other sectors show an opposite trend, with no overall trend evident.

A careful review of the women's and men's earnings distributions in 1958 and 1977, although not providing an answer to the above question, did produce some interesting statistics. The following tabulation shows the earnings of men and women at various percentiles of the distributions in 1958 and 1977:

	Distribution percentiles			
	20th	*40th*	*60th*	*80th*
Women:				
1958	$ 379	$ 1,062	$ 2,152	$ 3,324
1977	1,109	3,241	6,070	9,417
Percent change	192.6	205.2	182.1	183.3
Men:				
1958	$ 1,422	$ 3,342	$ 4,148	$ 6,141
1977	3,279	8,699	13,279	18,832
Percent change	130.6	160.0	185.7	206.7

Earnings for women at the 20th, 40th, 60th, and 80th percentiles in 1977 were near or about 200 percent higher than they were in 1958. In other words, earnings growth was fairly uniform across the distribution. Among men, however, a different picture emerges: earnings growth was much faster at the 80th percentile than it was at the 20th. One possible explanation for these different growth patterns and trends in inequality between men and women may result from differences in occupational patterns.

Despite their entry into many new occupations in recent years, women still tend to be clustered in a relatively few occupations, primarily clerical and service occupations, where opportunities for advancement are typically limited and earnings increases have been traditionally moderate. Men, however, are found in a variety of occupations and tend to dominate professional and managerial occupations where employment opportunities have expanded rapidly and earnings growth has been above average.

[1] The Gini indexes used in estimating the trends for full-time year-round workers were for the years 1967–1977.

[2] Statistically significant at the 1-percent level.

[3] Statistically significant at the 5-percent level.

[4] Trends were not estimated for these groups because of the lack of data.

THIS DISCUSSION may necessarily appear incomplete because changes in the distribution of earnings, no matter how thoroughly analyzed, cannot be labeled "good" or "bad." No consensus has been reached on what constitutes an optimum distribution. Some may argue for a more (or less) egalitarian society, but few, if any, have ventured to set forth the outlines of a pattern of distribution to be used as a goal in public policy. The current state of knowledge, though imperfect, does recognize the necessity of avoiding extremes: absolute inequality would stifle all freedom, absolute equality would produce a very dull society.

Because levels of earnings are affected by many factors, including effort, skill, knowledge, inheritance, family status, and luck, it becomes difficult, if not impossible, to single out the specific factors responsible for any given change in earnings distribution. Even if one wished to eliminate the element of "luck," he or she would be hard-pressed to know how to proceed. Yet the extent to which wealth and income are widely or narrowly distributed does reflect the nature of society and its economic system. Greater attention to earnings distribution data can yield more understanding of economic forces and the actions needed to effect change. ☐

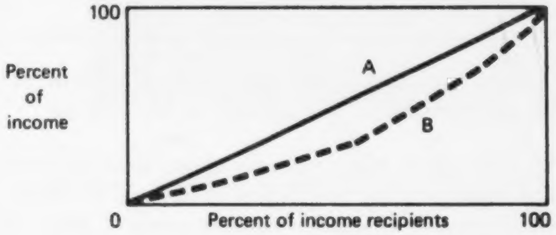
[3] The Gini index (developed by an Italian statistician, Corrado Gini, 1884–1965), can best be described by the use of the following diagram:



If recipients are ranked according to their income along the horizontal axis and their total income is placed on the vertical axis, Line A will represent complete equality (10 percent of income recipients received 10 percent of income, etc.) Line B (Lorenz curve) may represent an actual distribution which always falls below the diagonal. Gini index is the ratio of the area between the two lines to the triangle below Line A, and is always less than 1.0. The closer the Gini index is to zero, the more equal the distribution.

[4] The method used by the Bureau of the Census to calculate the Gini indexes presented in this article differs slightly from the method used by the Bureau to derive the Gini indexes that were analyzed in an earlier article. Both methods used Pareto-linear interpolation and integration procedures to obtain the income quantiles and Lorenz Curves underlying the Gini indexes. The current scheme uses entirely consistent methods, whereas the earlier scheme sometimes combined Pareto and linear procedures in an inconsistent manner—moreover, the current scheme uses Simpson's rule for approximate integration in calculating the Gini indexes themselves, whereas the earlier scheme used the trapezoidal rule for approximate integration. For a more complete description of the improved methodology, see Emmett Spiers, "Estimation of Summary Measures of Income Size Distribution from Grouped Data," *American Statistical Association, 1977 Proceedings of the Social Statistics Section*, Part 1, pp. 252–57.

In addition, procedures for collecting and processing the income data were modified during the 1970–77 period, just as they were from time to time in the earlier years. These changes have been described in detail in the Census Bureau's *Current Population Reports*, Consumer Income, P–60 series, and have generally involved the procedures used in imputing income information for nonrespondents. Perhaps the most significant changes occurring in the 1970–77 period were those resulting in the revision of the 1974 income estimates. These revisions were necessitated not only by changes in the imputation procedures but also because of changes in the March CPS questions on income and work experience, changes in the number and detail of tabulated income intervals, and the correction of several small errors found in the previous processing system. Because of all these changes, the Census Bureau decided to revise the 1974 income statistics; consequently, this article contains 2 Gini indexes for the earnings distributions in 1974, one based on the old processing system and another based on the new system. For further information on the 1974 revision, see *Current Population Reports*, Series P–60, No. 105, "Money Income in 1975 of Families and Persons in The United States," Bureau of the Census, 1977.

[5] As an example of some of the research that has been done on the earnings differences between men and women, see Jacob Mincer and Solomon Polachek, "Family Investments in Human Capital: Earnings of Women," *Journal of Political Economy*, March/April 1974, Pt. II; Mary Corcoran, "The Structure of Female Wages," *The American Economic Review*, May 1978, pp. 165–78; Ronald Oaxaca, "Male-Female Wage Differentials in Urban Labor Markets," *International Economic Review*, October 1973, pp. 693–709; and Isabel V. Sawhill, "The Economics of Discrimination Against Women: Some New Findings," *Journal of Human Resources*, Summer 1973, pp. 383–95.

National Commission recommends changes in labor force statistics

The National Commission on Employment and Unemployment Statistics finds the U.S. system of employment and unemployment statistics fundamentally sound, but recommends many significant expansions and refinements of the data

ROBERT L. STEIN

How well does our system of employment and unemployment statistics serve the needs of users? Congress raised that question in 1976, established a commission to address it, and instructed the Secretary of Labor to explore ways of implementing the commission's findings.

When it reported last September, the commission concluded that U.S. labor force statistics are generally sound, but called for improvements in a number of areas. Last month, Secretary of Labor Ray Marshall told Congress that he agrees with most of the commission's recommendations and already has implemented a few of them. This article reports both on the commission's recommendations and the Secretary's response.

Earlier review—Gordon Committee

Since its inception in the 1940's, the labor force statistics program always has been the object of careful scrutiny by the agencies of the Federal government.[1] The statistical design and operation of the most comprehensive part of the system—the household data obtained through the monthly Current Population Survey (CPS)—has been the responsibility of the Bureau of the Census and the analytical responsibility since 1959 has been lodged in the Bureau of Labor Statistics. However, because of the central role of employment and unemployment data in the formulation of Government policy, the statistical procedures and the concepts and definitions have been subject to periodic review by interagency committees and by the Joint Economic Committee of the Congress. Moreover, because the statistics are so widely used in government and the private sector, the statistical agencies have never introduced major conceptual or methodological changes without providing an opportunity for interested parties to review and comment upon them.

The first presidential review committee was appointed by President John F. Kennedy in response to widespread public criticism of and doubts about the accuracy of the labor force data because unemployment remained high during most of 1961, even though economic recovery was clearly under way. That 6-member review group, known as the Gordon Committee because its chairman was Professor Robert A. Gordon of the University of California, delivered its report in 1962. Many of its recommendations for improvements in concepts and methods were implemented in a series of actions by the BLS and the Census Bureau over the ensuing 5 years.[2] Among the major changes were the following: the sample for the survey was expanded by 50 percent; the questionnaire was sharpened to minimize reliance upon volunteered information; discouraged workers were classified as not in the labor force but, for the first time, were explicitly measured; other information on persons not in the labor force was collected for

---

Robert L. Stein is Assistant Commissioner, Office of Current Employment Analysis, Bureau of Labor Statistics.

the first time; the age cutoff for labor force definitions was raised from 14 years to 16 years; the definition of unemployment included for the first time a specific indication of jobseeking methods used and of the jobseekers' current availability for work.

The Gordon Committee report resulted in many technical changes in the way the statistics were compiled, but did not basically alter their underlying conceptual or methodological structure,[3] and did not end the continuing controversy about the definition cf unemployment. This controversy has many variations, but it really comes down to one basic issue: should the Government's figures on unemployment reflect only those persons with a strong attachment to the labor force who suffer significant economic hardship when unemployed (for example, family heads), or should the Government's figures reflect *all* those seeking work plus those who do not seek work because they believe none is available and those who are on involuntary part time. The Government's present definition is clearly in the middle of these extremes—it includes all those not working who are currently seeking work (during the last 4 weeks) and are available for work (regardless of the strength of their labor force attachment or the degree of hardship involved), but it does not include workers on involuntary part time or discouraged workers.

The Levitan Commission

Whenever unemployment rises, as it did twice in the 1970's, the figures become subject to more intensive examination and heightened controversy. The late Commissioner of Labor Statistics Julius Shiskin tried to defuse this criticism by publicizing alternative unemployment measures[4] and by calling for the creation of another review commission inasmuch as 15 years had passed since the Gordon Committee was appointed. Another development that made conditions ripe for the appointment of a new commission was emergence in the 1970's of a new use for unemployment figures—that is, as a basis for the allocation of funds to specific localities for training and reemploying the unemployed. Because the Current Population Survey (CPS), which provides the data base for national estimates, was never designed for this purpose, indirect estimation methods have had to be used in conjunction with CPS benchmarks. Officials in cities and States who believed their unemployment problems were greater than indicated by the official statistics were increasingly critical of the State and local unemployment data, and this criticism spilled over onto the national monthly unemployment data.

As a result of these pressures, in October 1976, the Congress enacted legislation (Section 13 of PL 94-444) which mandated the appointment of a review commission to examine "the procedures, concepts, and methodology involved in employment and unemployment statistics and suggesting ways and means of improving them." The commission was appointed by President Jimmy Carter in April 1978.

The 9-member commission, chaired by Sar Levitan of George Washington University,[5] deliberated for nearly 18 months and delivered its final report to the Congress and Secretary of Labor Marshall, who is responsible for its implementation, on Labor Day 1979. The Secretary of Labor, as required by law, reported to Congress last month as to his response to each of the commission's recommendations—whether he considers them desirable and feasible and, if so, what steps he has taken or plans to take to implement the recommendations.

The commission's report, entitled, *Counting the Labor Force* comprises more than 300 pages and represents a distillation of extensive public hearings, the testimony of a broad spectrum of users, the findings contained in 33 background papers sponsored by the commission, and lengthy discussions among the commission members themselves.[6]

The commission concluded that the available data are useful in appraising current labor market trends, particularly at the national level. At the same time, the commission's judgment was that the data could be improved in several respects. In particular, the commission noted that more information was needed on "the qualitative dimensions of labor market experience" and on the dynamics of labor market behavior. The commission expressed a need for more comprehensive reporting on the link between employment status, workers' earnings, and family income. And it was critical of the adequacy of available data used as a basis for the allocation of funds to States and areas. In this case, it found that the statistical agencies of the Government were in a difficult situation because the monthly data needed to satisfy legislative requirements for thousands of small areas can only be generated by estimation procedures yielding data of doubtful quality.

The commission made nearly 90 recommendations for changes in the entire system of U.S. employment and unemployment statistics. (See exhibit 1.) Most of the recommendations apply to BLS, but a sizable number were also directed to the Census Bureau, and a smaller number involved the Department of Labor's Employment and Training Administration, the Department of Commerce's Office of Federal Statistical Policy and Standards, and the Department of Agriculture's Economics, Statistics, and Cooperatives Services. A few of the recommendations are directed to the Congress and its legislation affecting the allocation of money under the Comprehensive Employment and Training Act and other programs.

Despite the large number of recommendations, a fair assessment would be that this review commission, like

Exhibit 1. Summary of recommendations of the National Commission on Employment and Unemployment Statistics

Recommendation	Program affected	Agency affected	Status
Defining the labor force			
Define discouraged workers to reflect job search in last 6 months, current availability, and desire for work.	CPS	BLS Census	Accepted. New method being tested.
Continue to exclude discouraged workers from the labor force count, but collect data on them monthly and tabulate separately.	CPS	BLS Census	Accepted on an interim basis. Final decision subject to evaluation of new data.
Count Armed Forces members stationed in the United States as employed for national statistics, but do not include them in local area statistics.	CPS	BLS Census Defense	Accepted. Data to be provided by the Department of Defense.
Calculate employment/population ratio using the Armed Forces in both the numerator and denominator.	CPS	BLS	Accepted.
Define program participants in institutional training who are not actively seeking work as not in the labor force (rather than unemployed) and those in work experience programs as employed (rather than unemployed).	CPS	BLS Census	Accepted.
Linking employment status with earnings and income			
Publish an annual report on measures of economic hardship resulting from low wages, unemployment, and involuntary part-time work.	CPS	BLS	Accepted.
Adding labor market information			
Collect information on volunteer work every 3 years through a special supplement to the CPS.	CPS	BLS Census ACTION	Accepted, depending on CPS workload and budget.
Test the feasibility of collecting information from unemployed persons in the outgoing CPS rotation groups on their reservation wage, earnings on prior job, and type of job sought.	CPS	BLS Census	Accepted for an annual supplement, depending on CPS workload and budget.
(1) Collect detailed labor market information on the new survey of Income and Program Participation (SIPP) sponsored by the Bureau of the Census and the Department of Health, Education and Welfare.(2) If SIPP does not prove to be a suitable vehicle, expand the CPS questionnaire for the outgoing rotation group to collect more detailed information on source of income.	SIPP CPS	Census HEW BLS	Part 1 accepted. Part 2 rejected.
Obtain monthly information on whether employed respondents have begun new jobs within the past month, and if so, whether it was through job changing, new hires, or other method.	CPS	BLS Census	Accepted for an annual supplement, depending on CPS workload and budget.
Ascertain each month the school enrollment status of 16 to 24 year olds, including whether attendance is on a full- or part-time basis.	CPS	BLS Census	Accepted. New questions being tested.
Expand the CPS sample to produce more reliable monthly data for blacks and Hispanics and annual estimates for Asian and Native Americans.	CPS	BLS Census	Accepted, depending on budget.
Identify race and ethnicity in the CPS in the same manner as in the decennial census.	CPS	BLS Census	Implemented.
Determine usual hours worked for all employed persons and the reasons for working fewer hours.	CPS	BLS Census	Accepted. New questions being tested.
Use a specific hours cutoff (35 hours of more versus less than 35 hours) to determine whether the unemployed are seeking full- or part-time work.	CPS	BLS Census	Accepted. New questions being tested.
Improving data for consistently defined rural areas should be a consideration in the CPS redesign.	CPS	BLS Census	Accepted, subject to solution of technical problems.
Measures of economic hardship should include specific measures for the rural population.	CPS	BLS Census	Accepted as part of BLS annual report, if rural area data can be developed.
Extend the occupational employment statistics program to all States on a regular basis.	OES	BLS ETA NOICC	Accepted, depending on budget.

Exhibit 1. Continued—Summary of the National Commission's recommendations

Recommendation	Program affected	Agency affected	Status
Have occupational projections for the Nation, States, and areas systematically reviewed by the responsible agencies to analyze forecast errors and improve future projections. Provide a range of forecasts based on alternate assumptions, as a guide to errors in projections. Research should be undertaken by the BLS on the response of occupational supply and demand to market factors such as wage changes.	OOS	BLS NOICC	Parts 1 and 2 being implemented. Part 3 accepted, subject to solution of technical problems.
Conduct pilot studies by State employment security agencies to determine feasibility and costs of developing local occupational unemployment rates.	Unemployment Insurance OES	BLS ETA	Accepted in principle, but technical problems are severe.
Collect occupational mobility data in a special supplement to the CPS to find out whether respondents changed occupations in previous year and, if so, what their occupations were.	CPS	BLS Census	Accepted, depending on budget.
Include question on occupation, industry and place of residence 1 year ago on mid-decade and 1990 census.	1985 and 1990 census	Census	Will consider in planning process.
Insure that the new Standard Occupational Classification codes are broadly comparable with historical CPS occupational statistics.	CPS	BLS Census	Implemented.
Use civilian codes for military personnel in occupations with a civilian counterpart and develop new codes for other military occupations.	CPS	BLS Defense	Accepted, in principle, if data can be provided by Department of Defense.
Test the feasibility of expanding the BLS Labor Turnover Survey to trade, service, and other industries and linking a few basic demographic characteristics with the turnover data.	LTS	BLS	Accepted, depending on budget.
A job vacancy statistics program is not recommended unless new evidence shows that useful data can be collected in a cost-effective manner.	Job vacancy statistics	BLS	Decision depends, in part, on outcome of BLS pilot tests.
Consider a farm operator as self-employed.	Quarterly Farm Employment Survey	ESCS	Accepted, depending on user reaction.
Study occupational differential in agriculture to develop more detailed and meaningful agricultural occupational classifications for the Standard Occupational Classification system.	Quarterly Farm Employment Survey	ESCS	Accepted.
Explore the possibility of including labor turnover questions in the quarterly agricultural establishment survey.	Quarterly Farm Employment Survey	ESCS	Prior research and testing required.
Current Population Survey			
In the post-1980 redesign of the CPS, design 50 State samples to improve the efficiency of the survey.	CPS	Census BLS	Accepted.
Conduct intensified research and analysis on bias in the CPS data with an explicit timetable for publication of a set of total error estimates for prominent labor force series.	CPS	Census	Underway or planned.
Investigate the role of sample rotation bias in estimates by studying a group of addresses for 16 months to determine the number of new families moving into the residences. Collect information on the characteristics of those who move out, those who move in, and those who fail to cooperate initially, but subsequently participate in the survey.	CPS	Census	Underway or planned.
Assemble more information on the characteristics of noninterviews to improve estimation procedures.	CPS	Census	Underway or planned.
Conduct a study to determine whether the differential effects of rotation group bias on the ratio and composite estimate make use of the composite estimate desirable. Explore alternate methods of estimation.	CPS	Census	Underway or planned.
Include estimates of the "uncounted population" in the population controls used for the national and State labor force estimates; that is, adjust the population totals for the undercount.	CPS LAUS	Census BLS	Decision must await further developments.
Conduct a study of biases in the measurement of labor force status that arises from the use of proxy respondents. The investigation should be disaggregated for various groups in the labor force.	CPS	Census	Underway or planned.

Exhibit 1. Continued—Summary of the National Commission's recommendations

Recommendation	Program affected	Agency affected	Status
Establish a separate national CPS sample of approximately 10,000 households for a 2-year period to collect detailed supplementary labor market information that cannot be collected in the regular CPS.	CPS	BLS Census	Accepted, depending on budget.
Nonagricultural Establishment Survey			
Expand the BLS-790 sample to provide 508 published industry series and current aggregate employment estimates for all Standard Metropolitan Statistical Areas and remaining areas of States.	CES	BLS	Accepted within framework of program redesign.
Complete documentation of the BLS-790 program for use in studying possible redesign of the establishment survey.	CES	BLS	Accepted.
Expand research on methods used to adjust for bias in the BLS-790 employment estimates.	CES	BLS	Accepted within framework of program redesign.
Study the quality and coverage of the benchmark employment data from unemployment insurance records.	CES	BLS	Accepted.
Benchmark the BLS-790 employment data annually.	CES	BLS	Accepted.
Where sampling is inadequate, delete certain industries from the monthly tables in *Employment and Earnings*, but publish them in the annual bulletin.	CES	BLS	Rejected. Preference is to improve samples.
Revise the Standard Industrial Classification codes on a gradual and continuing basis.	CES	BLS	Accepted in principle. Technical problems being addressed.
Institute a formal continuing quality control program for the BLS-790 and ES-202 program.	CES	BLS	Accepted within framework of program redesign.
Evaluate the number of cells and degree of sample stratification annually at the time of benchmark revision to improve the accuracy of hours and earnings statistics, as well as employment statistics.	CES	BLS	Accepted in principle. Technical problems being addressed.
Conduct research to determine if any bias exists in reporting hours and earnings. Publish an expanded and more thorough statement of imprecision and bias for all estimates.	CES	BLS	Accepted in principle. Technical problems being addressed.
Test the feasibility and cost-effectiveness of collecting data on work hours of nonproduction workers through the BLS-790 program.	CES	BLS	Accepted within framework of program redesign.
Agricultural Establishment Survey			
Continue efforts to identify the overlap of list and area samples of employees through direct inspection of the social security list. The feasibility of collecting employment identification numbers for this purpose should be tested.	Quarterly Farm Employment Survey	ESCS	Partly implemented.
Restore the quarterly agricultural establishment survey sample to its pre-October 1979 level.	Quarterly Farm Employment Survey	ESCS	Accepted, depending on budget.
Institute a regular program of field quality control checks.	Quarterly Farm Employment Survey	ESCS	Accepted.
Include livestock series (SIC 0751) in the Department of Agriculture survey only.	Quarterly Farm Employment Survey	ESCS	Accepted, with reservations.
Reinstate BLS coverage of Standard Industrial Classifications 08 (forestry, hunting, fishing) and 09 (trapping).	Quarterly Farm Employment Survey	ESCS	Accepted.
Use payroll counts of all workers without regard to occupation.	Quarterly Farm Employment Survey	ESCS	Judgment reserved because of technical problems.
Modify the Department of Agriculture's sample design to permit derivation of quarterly average employment estimates. Monthly estimates should be published where reliability standards permit.	Quarterly Farm Employment Survey	ESCS	Judgment reserved because of technical problems.
Publish thorough documentation of the Department of Agriculture's quarterly agricultural establishment statistics program.	Quarterly Farm Employment Survey	ESCS	Accepted.

Exhibit 1. Continued—Summary of the National Commission's recommendations

Recommendation	Program affected	Agency affected	Status
Unemployment Insurance Statistics			
Improve data comparability among States by analyzing differences in the qualifying requirements and duration provisions of State unemployment insurance laws that affect the insured unemployment rates.	Unemployment insurance	ETA	Accepted.
Continue to collect the ES–203 data on characteristics of the insured unemployed through a Federal-State cooperative program.	ES–203	ETA	Accepted in principle. Other data sources being explored.
Assign full responsibility for the ES–203 program to the Employment and Training Administration.	ES–203	ETA	Accepted in principle. Other data sources being explored.
Fund a quality control program to enhance the accuracy and timeliness of the ES–203 through appropriations to the Unemployment Insurance Service.	ES–203	ETA	Accepted in principle. Other data sources being explored.
Analyze the characteristics of claimants over the last 15 or 20 years.	ES–203	ETA	Accepted in principle. Other data sources being explored.
Reinstitute collection in the ES–203 reports of the basic characteristics of the insured unemployed who exhaust their benefits.	ES–203	ETA	Accepted in principle. Other data sources being explored.
Comparing data from different sources			
Develop a spendable earnings series based on the new CPS quarterly earnings data (if the data prove reliable) to replace the series based on establishment data.	CPS CES	BLS	Research being conducted on CPS-based series. Establishment-based series will be continued at this time.
Longitudinal data			
Resume publication of gross flow data, if current defects can be satisfactorily reduced. In the meantime, these data should be published occasionally, with an accompanying warning about their reliability. Prepare monthy gross flow data time series tapes for public use.	CPS	BLS Census	Accepted, subject to solution of technical problems.
Prepare public use tapes containing longitudinal CPS microdata.	CPS	Census	Accepted.
Seasonal adjustment			
Pending further advances in regression or other methods of seasonal adjustment, continue the X–11 and BLS–SF methods for seasonally adjusting labor force data.	CPS CES	BLS	Accepted.
Adjust unemployment rates and other important current labor statistics on a concurrent basis.	CPS	BLS	Rejected.
Continue to revise adjusted historical data once a year.	CPS	BLS	Accepted.
Use the X–11/ARIMA method for seasonally adjusting major labor force series that are characterized by rapidly changing seasonality.	CPS	Census BLS	Accepted.
Develop standard errors for seasonally-adjusted data.	CPS	BLS	Accepted.
State and local statistics			
Expand the CPS to provide a maximum expected 6.5-percent coefficient of variation in the annual average estimates of unemployment for States and SMSA's with a population of 1 million or more, 11 major central cities and the corresponding remainder of States and SMSA's.	CPS LAUS	Census BLS	Accepted in principle. Proposal modified to improve data for 125 SMSA's within same budgetary constraints. Implementation depends on budget.
To meet requirements for monthly or quarterly State and sub-State statistics, update immediately the handbook procedures for estimating employment and unemployment. Update past CPS estimates to the current month in ways that	LAUS CES 1985 census	BLS Census	Accepted, subject to solution of technical problems, and budget.

Exhibit 1. Continued—Summary of the National Commission's recommendations

Recommendation	Program affected	Agency affected	Status
will minimize both the size of annual revisions to the estimates and the distortion of monthly movements. Along with expanding the nonagricultural establishment survey to provide current employment data for all SMSA's and the corresponding remainder of States, collect labor force information on small areas in the mid-decade census, if the expense is not excessive.			
Review present statistical requirements pertaining to the allocation of funds to States and localities, including the frequency with which statistics are mandated and the use of allocation formulas that place a premium on the accuracy of estimates.	Grant allocation	Congress Labor Commerce	Accepted in principle. Implementation depends on the Congress.
Avoid using monthly data for allocation of funds to States and localities. Use graduated allocation formulas, when feasible.	Grant allocation	Congress	Accepted in principle. Implementation depends on the Congress.
Administration and presentation			
The Office of Federal Statistical Policy and Standards should be consulted during the initial stages of legislative formulation by any department regarding potential factors to be used in formula grant allocations.	Grant allocation	Commerce	Accepted.
A statistical reliability note should accompany all legislative proposals, submitted, including cost estimates for any new or expanded data collection requirements.	Legislation	Commerce ETA BLS Other	Accepted with reservations.
Allow the BLS sole funding authority for the BLS-790, BLS-1219, ES-202, Occupational Employment Statistics, and Local Area Unemployment Statistics programs.	Federal-State programs	ETA BLS	Funding arrangements being negotiated by the affected agencies.
Provide funds so that the BLS can establish a training program for workers in Federal-State statistics programs.	Federal-State programs	BLS	Accepted with reservations.
Expand the BLS regional staff to assist State and local agencies in their statistical work.	Federal-State programs	BLS	Judgment reserved.
Continue to insulate the BLS statistical program from partisan influence.	Various	BLS	Accepted.
The BLS advisory councils should adopt a more active role.	Various	BLS	Accepted.
Establish a new advisory council broadly representative of the data user community.	Various	BLS	Rejected.
Prior to instituting major changes affecting current statistical programs, the BLS should conduct broad public information programs to describe the contemplated changes and solicit comments. Where appropriate, advance notice of planned changes should be published in the Federal Register.	Various	BLS	Accepted.
Review the Nation's labor market information system at least once each decade.	Various	BLS ETA Agriculture Census	Accepted.
Review the present array of alternative unemployment measures in light of the conceptual issues addressed in the recommendations of the National Commission of Employment and Unemployment Statistics.	Various	BLS	Accepted.

its predecessor the Gordon Committee, did not call for a basic overhaul in any of the major statistical programs or of the specific concepts, methods, or procedures in use. Its recommendations for changes in definitions are minor. The commission considered but rejected recommending the development of an annual index of economic hardship, and instead called for the publication of an annual report on this subject. It also considered and rejected the possibility of counting "discouraged workers" as unemployed. The major thrusts of the recommendations were to call for: (1) the collection, processing, analysis, and reporting of more data about the employed, the unemployed, and persons not in the labor force; (2) the expansion and strengthening of samples now in use to provide more reliable area, demographic, industry, and occupational data; and (3) the intensification of research into a number of long-term methodological problems. Many of the commission's recommendations were, in effect, encouragement for the statistical agencies to pursue efforts already under consideration or under way for data development and data improvement. Nevertheless, taken as a whole, the recommendations of the commission should have considerable impact on employment and unemployment statistics programs over the next several years simply because of the added weight and support provided by a prestigious body to specific decisions and courses of action. Some of the major specific recommendations are summarized in the following discussion. Except as noted, the Secretary of Labor endorsed these recommendations.

Labor force definitions

The commission spent a great deal of time considering possible changes in labor force definitions. For example, it considered the desirability of introducing cutoffs based on hours of work or hours of seeking work as criteria for inclusion in the labor force; of raising the age cutoff from 16 to 18; and tightening the definition of jobseeking by ruling out some informal methods. In the final analysis, it rejected all these courses of action and left the basic definitions almost completely intact.

Discouraged workers. The most controversial definitional issue considered by the commission was that of discouraged workers. The present statistical practice, recommended by the Gordon Committee, defines discouraged workers as persons who want to work but are not seeking work because they believe none is available, and classifies them as not in the labor force. Information is compiled and published on the number and characteristics of discouraged workers on a quarterly basis. The commission recommended monthly publication and a change in the criteria for defining discouraged workers. But, it urged continuing the practice of classifying them as not in the labor force, rather than as unemployed. The new criteria would involve determining whether a person had sought work in the past 6 months, and whether he or she was currently available for and wanted work. Persons who meet these criteria would be defined as discouraged workers.

The Secretary of Labor accepted the change in the definition of discouraged workers, but indicated that the *final* decision on their classification as "unemployed" or "not in the labor force" should await the accumulation and study of data under the new definition. In the meantime, discouraged workers will continue to be classified as "not in the labor force."

At present, two versions of a specific set of questions which would implement this commission proposal are being tested in the Census Bureau's 3,200-household "Methods Development Survey." If this recommendation is proven feasible, a change in the method of defining discouraged workers, and monthly compilation and reporting of the data, could go into effect in January 1983.

Armed Forces. One significant definitional change recommended by the commission was to include members of the Armed Forces among the employed for purposes of national statistics (but not to include them in local area statistics), and to include them in the numerator and denominator in calculating the employment-population ratio.

This recommendation was accepted by the Secretary, with the understanding that the decision might be reconsidered if there should be a change in military personnel policy (a shift from an all-volunteer armed services to a military draft). In implementing this definitional change, data will continue to be obtained from the Department of Defense, rather than through the CPS.

Economic hardship

The commission deliberated extensively about the merits of recommending the development of specific measures of "labor market-related economic hardship." An early draft of the commission's report, circulated in January 1979 for public comment, contained a formulation of such measures synthesizing information on weeks and hours worked and weeks looking for work in the previous calendar year; workers' annual earnings; and the incomes of their families in relation to the poverty line, which in turn is adjusted for family size. The draft report also contained an extensive discussion of the conceptual and technical problems in developing such measures. The commission's final recommendation was for BLS to develop an annual report in which data would be provided and analyzed on three aspects of individual labor market hardship—low wages, unemployment, and insufficient participation in the labor force. The commission recommended that these data, which would pertain to individuals, should also be analyzed in the context of family income and composition.

Secretary Marshall commented that this was potentially one of the commission's most important recommendations because the annual report could enhance public understanding of the relationship between employment status and family income.

Additional information

The commission devoted a significant part of its report to a discussion of recommendations for the collection of new information on the labor market, and the extension of coverage of existing programs. Of the 23 recommendations in chapters 6 and 7, 13 relate mainly to the CPS. The more significant recommendations pertaining to the CPS are the following:

1. The sample should be expanded to strengthen the reliability of data for racial and ethnic minorities. This is one of the objectives of the Census Bureau and BLS in planning for redesign of the CPS after completion of the 1980 decennial census.

2. There should be some testing of the feasibility of collecting monthly or quarterly information on the unemployed with respect to the lowest wage they will accept (their reservation wage), earnings on prior jobs, and the occupation being sought. This type of information has been collected in the CPS on an ad hoc basis in the past, although nonresponse rates have been comparatively high. Both the BLS and the Census Bureau have a strong preference for an annual supplement to the CPS as the best way to collect this type of information.

3. Monthly data should be collected on new jobs obtained by the employed, and whether they were obtained through a job change, a recall from layoff, entry into the labor force, or some other method. (Again, the statistical agencies prefer an annual supplement to collect this data.)

4. Monthly data should be obtained on the school attendance of youth, and whether enrollment is full or part time. Such information presently is available only in October; in other months, proxy information is available from a question on major activity during the survey week, but this is a less satisfactory approach. Questions on school enrollment are included in the Methods Development Survey test panels.

5. Questions on usual hours of work, and reasons for working fewer hours, should be asked of all workers rather than only those working 1–34 hours as is done presently. These are also being tested in the Methods Development Survey.

6. Special supplementary inquiries should be conducted on occupational mobility and volunteer work.

Other programs which would be expanded by the commission are the Occupational Employment Statistics program which would cover all States, and the Labor Turnover Survey which would cover all industries.

The commission recommended against the further development of a job vacancy statistics program "unless new evidence is presented that useful data can be collected in a cost-effective manner."

Recommendations which involve (1) extension of sample coverage to additional population groups, States, or industries, or (2) the addition of questions to the CPS questionnaire, depend for their implementation on the availability of resources—both staff and financial—and on the resolution of some technical problems. The only controversial recommendation is that on job vacancy statistics. The commission recommended against collection of such data; however, the Secretary of Labor noted that a decision in this area must await the results of BLS testing activities.

CPS methodology

There are two major recommendations relating to sampling and estimation. The post-1980 redesign on the CPS should be based on 50 State samples to improve the efficiency of the survey. This has all along been one of the basic planning assumptions of the Census Bureau and BLS in the work on the redesign. The commission also recommended that estimates of the "uncounted population" be included in the population controls for the national and State labor force estimates. This is a very controversial recommendation because it affects the data used for many different government programs, and because estimation of the undercount below the national level is fraught with problems. The Census Bureau sponsored a special conference of academicians and policymakers in February 1980 to discuss the issues raised by the population undercount and the kinds of data and methods that might be used to adjust the census counts. A recommendation on this sensitive issue will be made by the Census Bureau to the Department of Commerce sometime during the next 12 months.

Other recommendations on methodology call upon the Census Bureau to intensify its research efforts into the various biases which have been long known to exist in the CPS.

BLS nonagricultural establishment survey

The commission presented several technical recommendations designed to improve the accuracy of the BLS industry employment statistics obtained through the monthly establishment survey. The commission also called for an expansion of survey coverage to additional industries and to all Standard Metropolitan Statistical Areas (SMSA's) and remaining areas of States. The latter was considered useful in its own right as well as for the purpose of improving the monthly employment estimates used in the calculation of the labor force and unemployment rates for local areas in the Local Area Unemployment Statistics (LAUS) program. The recommendations on improving the accuracy of these data are being considered by BLS within the framework of a multi-year redesign of the program of industry employment statistics.

Gross flow data. The commission considered gross flow data to be extremely important in providing insight into the dynamics of labor force behavior. The gross flow data provide the user with estimates of the total number entering the labor force (gross inflow), those leaving the labor force (gross outflow) each month, as well as gross shifts between employment and unemployment. These data have received increasing use, though still limited because they are known to be subject to several kinds of biases which cannot be readily measured. The commission does not offer a solution to this problem but urges the statistical agencies to reduce the defects in the data to an acceptable level, and to begin publishing them at least annually, with appropriate caveats.

Seasonal adjustment. The commission recommended that the seasonal adjustment of major labor force series be converted to the X-11 ARIMA method and that the seasonal adjustment be on a concurrent basis.[7] The X-11 ARIMA method (which includes a provision for forecasting the original series 1 year ahead) has been found to be particularly effective for series whose seasonal patterns are changing, and for identifying turning points in the business cycle. The concurrent method would involve developing seasonal adjustment factors for each month by using all the available data, including the current month, and then revising the entire series at the end of each year. However, the concurrent method would preclude the prior announcement of seasonal factors for future months. In January 1980, the BLS shifted to the X-11 ARIMA method but not to the concurrent method. There will be a recomputation and prior announcement of factors every 6 months, but revision of the entire series only once a year.

Local Area Unemployment Statistics (LAUS)

This program is discussed extensively in the commission's report. There are four basic recommendations:

- Expand the CPS sample substantially so that annual benchmarks for States and 35 large SMSA's will be significantly improved.
- Update and improve the so-called "handbook procedure"—a building-block approach to estimating unemployment by month by area, using unemployment insurance administrative data as its primary input.
- Collect labor force information in the mid-decade census in order to improve local area unemployment estimates.
- Have the Congress review and possibly modify the statistical requirements imposed by various legislative enactments.

The BLS and the Department of Labor endorsed the commission's proposal to interview a larger number of households each month to obtain more reliable data for States and metropolitan areas. However, the Department believes that it would be more desirable, within the same budgetary framework, to improve the data for the 125 largest SMSA's (containing about 62 percent of the Nation's population), sacrificing some of the proposed improvement for the 35 largest SMSA's. This alternative would provide for a much larger number of metropolitan areas benchmarked to the CPS and should lead to greater equity in the distribution of Federal money. In addition, this proposal would provide annual average data on the demographic characteristics of the employed and unemployed in these areas, which should be of substantial value in program planning and policy analysis.

The sample expansion is being incorporated into the planning for the CPS redesign. Implementation depends, of course, on the availability of financial resources.

The BLS is exploring the feasibility of various means of improving the handbook procedure and has let a contract with Mathematica Policy Research Corp. to develop an improved handbook-type methodology, including an investigation of regression techniques as recommended by the commission. However, it is too early to tell what the results of this research will yield. The fate of the other recommendations is also uncertain at this time.

Other recommendations

Presentation of data. The commission's recommendations in this area were not very extensive, calling for an improvement in the explanatory note to the press release (already implemented by BLS), and a review of the U_1–U_7 alternative measures of unemployment. These measures are being reviewed by BLS.

Administration. The commission made a variety of recommendations, involving such issues as the statistical requirements imposed by legislation, the funding of Federal-State programs, the training of State personnel, the utilization of advisory committees by the BLS, and a comprehensive review of the labor force data system at least once a decade. The commission offered a number of constructive suggestions which could impact the environment in which statistics are developed, but will have little short-term effect on the data themselves.

REACTIONS TO THE OVERALL thrust of the commission's recommendations have been largely favorable, although several agencies including BLS and the Census Bureau have expressed disagreement with one or more of the specific proposals. Implementation of many of the recommendations will involve a lengthy process and, in many cases, will depend on the availability of resources and the ability to solve some very difficult technical problems that have thus far defied solution. In any event, there will be another progress report to the Congress on implementation of the commission's proposals. The law requires the Secretary of Labor to submit a final report within 2 years after the commission's final report (that is, on or before September 3, 1981) detailing the actions taken with respect to the commission's recommendations. □

Frances Perkins, Isador Lubin, and the Bureau of Labor Statistics

As Commissioner of Labor Statistics, Isador Lubin worked closely with Secretary of Labor Frances Perkins to meet the urgent need for data stemming from the Great Depression

JOSEPH P. GOLDBERG

The memory of the first woman to be appointed to the Presidential Cabinet is being signally honored this month, with the designation of the Department of Labor Building in Washington, D.C., as the "Frances Perkins Building."[1] Frances Perkins' influence as Secretary of Labor was prominent in the New Deal program seeking to create employment to cope with the Great Depression, and with broad social legislation of lasting influence—the Fair Labor Standards Act, the Social Security Act, and the Wagner Act. Upon assuming office in the new administration of President Franklin D. Roosevelt, Perkins made clear her concern with the role of the Bureau of Labor Statistics by immediately initiating a review of the Bureau's statistics, and a search for a Commissioner of Labor Statistics. Her choice of Isador Lubin was an inspired one—resulting in a relationship which extended to concerns beyond the Bureau, and even the Department, for Lubin also became a trusted confidant of President Roosevelt.

In the process, the Bureau of Labor Statistics made its transition to a forward-looking agency, geared to the requirements of a wartime, and later, to a growth economy. This article deals with the Perkins-Lubin relationship as it determined the role of the Commissioner of Labor Statistics, and the development of the Bureau's programs.

Isador Lubin's death in July 1978, at the age of 82, terminated a long career, in which he had been Commissioner of Labor Statistics for a period of 13 years, from 1933 to 1946. He was the Bureau's fifth Commissioner. When he assumed the post, it was with a clear view, shared by Perkins, that he would seek to bring the Bureau into a position compatible with its established reputation, and the economic and social needs of the time. The New Deal concern with the status of workers, encouragement of labor organization, and development of collective bargaining accentuated the need for improved and modernized statistics and analyses of socioeconomic conditions. Lubin, with the active support of Perkins, and by his personality, experience, and expertise in labor economics, and his facility for dealing with and inspiring confidence in the varied groups with which he dealt, provided the impetus for the Bureau's growth. This forward-looking adaptation has persisted over the second-half century of the Bureau's existence.

BLS in the 1920's

Perkins and Lubin had dealt with Commissioner of Labor Statistics Ethelbert Stewart during the 1920's. When Perkins was New York State Industrial Commissioner, her agency had cooperated with the Bureau in the development and expansion of the Bureau's employ-

---

Joseph P. Goldberg is special assistant to the Commissioner of Labor Statistics. This article is the first of a series in recognition of the centennial of the Bureau of Labor Statistics, which was established by Congress in 1884. A centennial history of the Bureau is being prepared by Goldberg, with the assistance of William T. Moye.

ment series. Lubin, at the newly established Brookings Institution, was a leading participant in the economic advice and research provided by Brookings. He conducted studies of the effects of technological unemployment, and of British experience in dealing with unemployment. He was actively involved in the growing Congressional awareness of the need to identify the scope, characteristics, and ameliorative approaches to growing unemployment. He was loaned by Brookings in 1928 and again in 1930 to serve as economic counsel to Senate committees considering legislation to deal with unemployment, and with the establishment of a national economic council to aid in governmental economic planning. He worked closely with Senators Robert M. LaFollette, Jr. of Wisconsin, James Couzens of Michigan, and Robert Wagner of New York.[2]

Although BLS was recognized as a valuable and technically capable institution by technical experts and professional societies, the Bureau's opportunities to modernize and improve its work were restricted during the 1920's by appropriations which, though doubling in the 25 years to 1930, had only kept pace with increases in salaries and the cost of field work. Even when the Congress called for improvements in the scope and coverage of employment statistics, the appropriations followed late and were either threatened or eliminated.

Support for expansion in Federal statistical programs in the 1920's was determined by the influence associated with farmers and businessmen in the prevailing economic climate. During the administrations of Presidents Warren Harding, Calvin Coolidge, and Herbert Hoover, the economic plight of farmers resulted in support for expanded agricultural statistics, if more direct aid was not received. As Secretary of Commerce for 8 years, Hoover encouraged the provision for adequate statistics to business, "because businessmen were making the most important economic decisions."[3]

Stewart's proposals for increased appropriations were met with frequent Congressional reactions suggesting reductions instead, in the interest of economy. Asking for increases to base the semiannual cost-of-living index on expanded and modernized expenditure patterns of wage earners, he was pressed instead to justify the greater costs involved in field visits, rather than mail schedules, in the conduct of industry wage studies and the pricing for the cost of living index.[4]

The analytical reports of the Bureau adapted to the changing economic and social scene, continued during the 1920's, despite budgetary limitations. Wage and hour studies of individual industries were scheduled at 5-year intervals, with such new industries as motor vehicles and airplanes, along with the previously initiated studies of coal mining, meatpacking, and textiles. Productivity studies in individual industries were developed during the 1920's, reflecting interest in the impact of new technologies. Bureau work in industrial accidents and hygiene continued to be prominent.

The continuing concern in the 1920's over the state of employment, and the absence of adequate unemployment information, provided the Bureau with resources, albeit limited and lagging, to expand its work in the employment field. The study of employment and payrolls had begun in 1915, gaining momentum when the downturn of 1921–22 resulted in awareness of the uncertainty of unemployment information. President Harding's Conference on Unemployment in 1921, chaired by Hoover, included a variety of unemployment estimates. The Department of Labor's U.S. Employment Service estimated unemployment at 3.5 million, while BLS reported an employment shrinkage of 5.5 million. With so many wide-ranging guesses, the conference "merely voted to announce to the country that the number unemployed was between 3.5 million and 5.5 million, numbers startling enough to challenge attention."[5]

The conference resulted in increased appropriations to the Bureau to expand its coverage of manufacturing industries, and continued study by the American Statistical Association's Committee on Governmental Labor Statistics. The committee's recommendations called for the BLS to be the coordinating center for the States and any other Federal agencies gathering employment data. BLS was called upon to expand its industrial coverage from manufacturing and first class railroads, to include mining, communications, building construction, wholesale and retail trade, and agriculture.[6]

Unemployment increases

In 1928, concern with growing unemployment was again prominent in Congress. Increased appropriations permitted the Bureau to expand coverage to nonmanufacturing industries. Both Stewart and Lubin were involved in the landmark Senate hearings in 1928–29, chaired by Couzens on the bills introduced by Wagner, covering comprehensive unemployment measures.

Ethelbert Stewart testified on the "shrinkage of employment," and, as he did over the years, stressed that the Bureau's employment index was not an unemployment measure. Lubin, who had been involved in a Brookings Institution study of the absorption of "dispossessed" or discharged workers by industry, was loaned to the Senate Committee as economic adviser.

Lubin's analysis of the witnesses' testimony and of the Brookings study were important contributions to the committee. The Brookings study, he pointed out, had shown that most displaced workers have great difficulties in finding new lines of employment. Lubin supported Stewart's expression of the need for a census of unemployment for benchmarking purposes, approved of the efforts underway to expand the reporting sample, and agreed that coverage of part-time employment be added. In a period of Federal laissez-faire in regard to unemployment, Lubin's assessment that "unemployment is the result of industrial organization, and not of individual character," would receive catastrophic confirmation in the forthcoming Great Depression.[7]

With the onset of the crash of 1929, and the attendant depression and unemployment, statistics became a focus for approaches to the problems in the labor market. The continuing controversy over the extent of unemployment was reflected in the debate surrounding Hoover's press conference release in early 1930 announcing an increase in employment. Perkins, New York State Industrial Commissioner, responded that these statistics were questionable. She noted that these had not been attributed to the Bureau of Labor Statistics, whose estimates were viewed as honest and reliable on the basis of long association. Further, the New York State experience showed a decline in employment. Perkins' estimate was confirmed with the release of the official BLS report on employment.[8]

In the remaining period of Stewart's stewardship, the employment statistics remained a sore point. Secretary of Labor Doak and Stewart differed in early 1932 on the interpretation of the statistics. When newspapermen checked with Stewart, Doak publicly rebuked the Commissioner. Subsequently, at age 74, with 45 years of government service, with more than a year remaining for completion of his term, Stewart was not included by President Hoover on the list of those for whom extensions were requested beyond mandatory retirement age.[9] Charles E. Baldwin was named acting commissioner for the balance of Stewart's term.

The statistical ambience

The longtime experience of Perkins as New York State Industrial Commissioner provided an awareness of the role of the Bureau of Labor Statistics in economic policy. She was equally aware of the need for obtaining support to modernize that role to meet the requirements of the social and economic policies required to cope with the depression conditions of 1933. It was crucial to her concerns that the new Commissioner meet the challenge of changed requirements. The breadth of Lubin's interests and experience was known to her, and she expected that he would provide broad economic and social perspectives in dealing with the statistical programs of the Bureau. As her biographer states: "When Perkins offered him the post, she told him he had been chosen because she thought he would remember that statistics were not numbers but people coping or failing to cope with the buffetings of life. She evidently stressed this point to Roosevelt, for he later repeated it to Lubin."[10]

The conjoint interests of Perkins and Lubin went to both the improvement of the Departmental statistical program and to ensuring the effective coordination of the statistical programs of the Federal Government. Upon her appointment, Perkins immediately invited the president of the American Statistical Association to confer and advise "regarding the methods, adequacy, usefulness, and general program of the Bureau of Labor Statistics." Immediately following his appointment as Commissioner, Lubin became involved directly in both the work of the Advisory Committee to Perkins, and in the broader efforts toward establishing a central statistical board. Lubin welcomed the advice and counsel of this committee of technical experts. Its members included Ewan Clague and Aryness Joy, who later served together as Commissioner and Deputy Commissioner of BLS. The review of the Bureau's programs continued for more than a year.

Lubin and Perkins agreed on the role of the Central Statistical Board, in that it would ensure consistency in approaches on the part of Government agencies, avoidance of duplication, and attainment of economies. But a centralized statistical agency was opposed, for as Lubin stated: "In terms of the usefulness of statistics, it probably is cheaper in the long run, despite the additional cost of duplicated overhead, to have smaller decentralized units collecting data which are of maximum usefulness in formulating policies and solving problems, than it would be to have a centralized and consolidated statistical agency collecting data on a series of unrelated subjects, which data do not have the realism necessary to give them effective usefulness."[11]

Lubin's role in the formation and functioning of the Central Statistical Board was persistent, and he urged Perkins to actively participate. He was among an unofficial committee which proposed its establishment to members of the Roosevelt Cabinet, and then served on it as the Department of Labor representative.[12] He obtained Perkins' endorsement for a permanent Board. The legislation subsequently made the Board the joint responsibility of a Cabinet-level Central Statistical Committee, consisting of the Secretaries of Labor, Commerce, Treasury, and Agriculture. Lubin urged Perkins to press with President Roosevelt her claim to be chairperson. Perkins was designated chairperson of the Cabinet-level Central Statistical Committee, with Lubin serving as vice-chairperson of the Central Statistical Board.

Lubin and Perkins were active in using the Board to meet the threat of duplication by the statistical activities of the National Recovery Administration (NRA) to the longstanding activities of BLS and other established agencies. Perkins wrote to Roosevelt and to Hugh Johnson, Director of the NRA, citing the duplication as resulting in refusals by some employers to continue to submit reports to Government agencies. Attention was called to investigations conducted by the Central Statistical Board, and to a Board resolution calling for an Executive Order rectifying the situation.[13]

Controversial order issued

The Administrator for Industrial Recovery responded by issuing an order requiring industries under codes to furnish data directly to the Bureau of Labor Statistics, and Federal and State agencies working in cooperation with the Bureau. Some representatives of industry associations questioned the order, so Lubin met with trade association executives to explain why the direct Government collection was necessary for uniform and timely reporting.[14] In meeting with representatives of State labor departments and interested Federal agencies on the broad authority under the NRA order, Lubin cautioned on the need for care in maintaining and improving existing reporting relationships based on established voluntarism and confidentiality. While "under this order we have for the first time legal authority to secure these data," Lubin cautioned, "We don't want to use that power though, we would rather it would be a cooperative venture . . . . These data are confidential and not to be used for enforcement purposes."[15]

Perkins encouraged Lubin's broader role including his participation in economic meetings at the White House. He prepared economic analyses for Perkins directly, and for the Cabinet-level Central Statistical Committee, of which she was chairperson. Lubin was elected by the committee to serve as secretary, and to prepare for the committee a periodic economic analysis and report, which would also be abstracted for presentation to the National Emergency Council. Perkins wrote Roosevelt, that the "value of this arrangement would obviously be enhanced by Dr. Lubin's membership in the National Emergency Council. May I recommend and request that you designate him?"[16]

Lubin was soon called upon by the White House in a variety of situations. He participated in the discussions held by Roosevelt with business, labor, and government policy officials in meeting the recession of 1937 and soon after, Lubin was the first witness called at congressional hearings on unemployment.[17] In June 1938, when the Temporary National Economic Commission was approved by Joint Congressional Resolution, following a Presidential message, a letter from the President called on Lubin to cancel a commitment to lecture at the Summer School of the University of California. Roosevelt requested, "In view of the passage of the Wage and Hour Bill and of the Congressional resolution providing for an investigation into monopoly conditions in American industry, I think it would be helpful if you could arrange to remain in Washington until such time as the Monopoly Commission can formulate its agenda and the preliminary organization necessary for the administration of the Wage and Hour Bill can be set in motion."[18]

The culmination of Lubin's partial association with the White House occurred in May 1941, when he was appointed as special statistical assistant to President Roosevelt.

Lubin as Commissioner

Lubin's primary goal for the Bureau, with Perkins' encouragement, was the development of a professionally-staffed organization prepared to meet the requirements of the rapidly evolving New Deal policies affecting the status of workers. Not only were the ongoing statistical activities of the Bureau, particularly in employment and prices, to be improved and modernized; appropriate analytical treatment would be given to these statistical reports. The Bureau's programs in the field of labor-management relations were to be expanded to meet the requirements of new policies. These goals were intensified by the many special activities in which Lubin himself and the Bureau were involved, as social and economic concerns of the Department of Labor under Perkins were broadened to meet the burst of New Deal legislative development.

The Bureau expanded substantially under Lubin's direction, but the process was slow and uneven. When he took over in 1933, the Bureau's budget had just been cut from $580,400 to $450,000, with the staff reduced from 240 to 211, as part of overall economy measures. Emergency funds compensated for part of a further reduction the following year, with the staff increasing to 318. In succeeding years, the regular budget had more increases than decreases, and was supplemented by funds transferred from other agencies for special studies. By 1940–41 the regular budget had increased to about $1.1 million, and the staff to more than 800 (690 in Washington and 120 in the field).

The annual report for the Bureau initially bearing Lubin's imprimatur stressed that professionalization of staff and interpretation and analysis were to go hand in hand. The program needs in the price area were expressed in terms of consumer information needed to cope with the unwarranted increases allegedly due to the National Industrial Recovery and Agricultural Adjustment Acts. Employment data required expansion to permit assessment of the effects of industrial revival. Studies of industrial wages and hours required expansion and greater currency to meet the code-formulating activities of the National Recovery Administration (NRA). In summary, the report stated, "Not only must raw data be improved but the Bureau must be enabled more fully to analyze the material it now has, so that evidence may be available as to where the recovery program is having the greatest effect and where it is falling down. The Bureau is not at present in a financial position to employ the economic analysts necessary for such interpretations."[19]

The need for improvising to meet the gargantuan demands of the emergency situation, and particularly of the NRA, was stated by both Perkins and Lubin at appropriation hearings in December 1933. With BLS assuming responsibility to provide information for the codes, personnel were detailed from inside and outside the Department. As Perkins stated, "The Bureau of Labor Statistics has turned itself out in order to get this information and to make it available in a form that was easily understood and readily used by people who had the responsibility of taking some action." Lubin added that every labor group involved in any NRA code had had to go to the Labor Department for information.

Lubin indicated the lengths to which ingenuity had had to be applied to meet pressing needs, absent adequate resources: "I do not want to appear to boast, but I think I am one of the few officials who have actually gone out and borrowed people from other departments of the Government and put them to work during their spare time getting materials for which we would otherwise have to pay."[20]

Efforts take effect

By mid-1935, it could be reported that improvements in organization and working methods had proceeded efficaciously. An industrial relations division had been established, and a survey of employer-employee relationships was underway. Statistical reporting had been improved with more commodities and communities covered in retail food reporting. The cost-of-living index, as it was then called, had been placed on a quarterly basis, from its former semiannual appearance, and reflected improvements in weighting and food price coverage. The monthly employment report continued to receive improvements. Benchmark adjustments to the Census of Manufactures were introduced for the first time—with coverage now extended for 50 percent of the wage earners of the country, including nearly complete coverage for employment resulting from Federal appropriations. Efforts were being made to include in the regular industry wage surveys such matters as age of workers, length of service, annual earnings, occupational descriptions, and personnel policies. An investigation of the expenditures of employed wage earners in 1934 was expanded during 1935–36 to a broad investigation in which the Works Progress Administration, the Department of Agriculture, and the National Resources Commission collaborated with the BLS in the study of consumer purchases, which presented consumption estimates for all segments of the population, both rural and urban. These provided the basis for the introduction of a comprehensively revised consumers' price index in 1940.

By the recommendation of an advisory committee to the President, an occupational outlook section was established in the Bureau in 1939, but its initial intent to provide career guidance was not to be effectuated until after the war. Instead, it was absorbed in projections of manpower supply and needs for defense industries. In this, Lubin's specifications for the office and the duties of its chief were anticipatory of the defense and wartime role of this service.

Lubin was ever on the alert for capable staff. A. Ford Hinrichs was brought in as chief economist, Sidney Wilcox had already been employed as chief statistician, and Aryness Joy joined the BLS staff as a senior economist. Young economists seeking employment in government received ready encouragement from Lubin. He was readily accessible to staff, and stimulated interest in the expanding role of the Bureau. Before the American Economic Association, he proselytyzed for the role of government economists. He contrasted the limited and circumscribed environment of the academic researcher with the opportunities offered by "Federal economic research, with its ramifications into the political and sociological aspects of virtually every problem that comes within the public eye, and has a great opportunity to break down these barriers," between economics, sociology, and political science.[21]

The burdens confronting the Bureau during the NRA period slowed up the process of reorganization. Added to this were the special tasks assigned to the Bureau, and to Lubin himself by Perkins. For almost 3 years, as chairman of a Labor Advisory Board to the Public Works Administration (PWA), he dealt with questions relating to the referral of union and nonunion workers to construction projects, job opportunities for black skilled workers in view of their exclusion from building trade unions, observance of arbitration awards, and predetermination of wages. A trying situation in which Secretary Ickes of the Interior Department was concerned that black workers should be issued work permits on certain PWA projects in Chicago, was personally mediated by Lubin. He obtained agreement for black employment of at least 13 percent of unskilled workers and 3 percent of skilled workers, the proportions shown in various crafts in the 1930 census.[22] Criticized for making a wage determination of 40 cents an hour for unskilled labor in the South as excessive, Lubin responded that Congress had mandated a standard of living of decency, not an "economic wage," as contended by the contractors.[23]

Lubin served as chairperson of a board to settle a strike of citrus workers in Florida. The report of the board called on Secretary Henry Wallace to have the Department of Agriculture insist on inclusion of a code for labor-management relations in the market agreement approved for the citrus industry by the Agricultural Adjustment Administration. The subsequent failure to set such minimum labor conditions despite the urgency of the situation, was noted by Lubin.[24]

Lubin was designated by Perkins as chairperson of a departmental committee to look into the promotion of U.S. membership in the International Labor Organization (ILO). Following U.S. entry into the ILO in August 1934, the United States was represented for the first time at an ILO Governing Body meeting in January 1935, with Lubin as the Government delegate. The Bureau was given responsibility for the administrative arrangements for the permanent Geneva representation, including requests for appropriations in its budget.[25] Lubin continued to attend these meetings, particularly those involving planning for international instruments on statistical standards and hours of work.[26]

The mutually supportive relations between Lubin and Perkins were often explicitly recognized in stressful situations. When a resolution of Congress called on the Secretary of Labor to make a study of the economic needs of migratory labor, which Lubin indicated the Bureau would undertake, Perkins' reaction was "I have the feeling that everything that is difficult gets to you." Shortly thereafter, preparing suddenly to go on vacation, Perkins not having had time to say goodbye to Lubin, wrote: "I want to thank you sincerely for all that you have done to make the work of the Department a success and to tell you how much it means to me personally to realize the loyalty, interest, and integrity with which you are carrying on the work of your Bureau."[27] In his turn, when the U.S. Employment Service was transferred from the Department of Labor to the Federal Security Administration, with a like possibility for the Children's Bureau, Lubin urged that "all of us should use every means to keep constantly before the President the fact that transfer is inimical to the interests of American labor . . . . "[28]

External relationships

Lubin's ability for effective relationships was crucial to the workings of the Bureau in a period of substantial changes in the role of government. His straightforward, direct approach with representatives of labor organizations, of major companies and trade associations, and the press, made him influential in all these areas. This was evident even as he analyzed the Bureau's data, and as he indicated his views on major economic issues.

Early in his administration, Lubin called a meeting of labor union research staff members, to meet with the BLS and the Advisory Committee to the Secretary of Labor. Reporting on the committee's statistical review, and the rapid introduction of accommodating changes by the Bureau, Lubin stated: "The ultimate purpose is to provide statistics which will do for the wage earner of this country what the Department of Agriculture is doing for the farmer, that is, supply laboring people with information as to what is happening in such detail that they can make their own plans and develop their own programs." The institution of the Labor Information Service, in the form of a monthly bulletin was also announced, for "the attention of local officers and the intelligent members of locals, so that these people will know what is happening. . . . in the country as a whole as well as in his own particular industry."[29] Relations with the trade union research staff members continued on an informal basis until June 1940, when a formal and continuing advisory relationship was established.

Salutary relationships with management, as extensively as possible, had been an inherent requirement for the Bureau's conduct of its activities, particularly in wage studies and employment data collection. Lubin contributed greatly by maintaining personal relationships with many corporate executives, in which he candidly exchanged views on major issues. He was intimately involved in resolving issues which might threaten the Bureau's activities, and generally, his directness and persuasiveness kept such occurrences minimal.

Sensitivities developed, but were overcome, over a Bureau study on the delicate subject of company unions, of interest to Perkins, Lubin, and Francis Biddle, chairperson of the National Labor Relations Board. This study, in 1934, was intended to obtain a proper picture of these organizations to meet the needs of the two labor agencies. At an estimated cost of $15,000, Perkins' proposal for a joint study was accepted in short order.[30] David Saposs, who had just completed a study on the subject for the Twentieth Century Fund, was hired as director of the study. At an informal meeting of BLS with American Federation of Labor representatives, the latter expressed some uncertainties over such a study, suggesting emphasis on the study of collective bargaining agreements, rather than what was viewed as merely "an arm of management."[31]

In September 1935, Lubin reported to Perkins on the interest stimulated among union officials in the study, and their requests to have the report issued as soon as possible. "Somehow or other a rumor has been spread that this bulletin may be suppressed."[32] The preliminary report in the *Monthly Labor Review* stirred up a temporary tempest.[33] A communication from the National Association of Manufacturers advised Lubin that some member firms of the association, some of which had participated in the survey, now felt that the conclusions might be misleading as to the employee representation plans. The opportunity to discuss the matter was offered, and immediately accepted by Lubin, who responded: "If members of the NAM feel that our study on company unions attempts to establish standards of employee representation plans which may result in misleading conclusions as to their functions and operations, I want very much to secure their full and unbiased opinions."[34] Immediately thereafter, the Journal of Commerce was to report: "Although resentment in industrial circles against the recent study on company unions prepared by the BLS continues high, it now seems doubtful an organized boycott will result."[35]

The relations between the automobile industry and BLS also underwent a period of difficulty. In January 1936, the Automobile Manufacturers Association advised the Bureau that information for individual companies in the industry would no longer be furnished directly to the Bureau, and that individual plants would not be identified, except by a code to make monthly comparisons for individual plants. Lubin wrote the association that he viewed this "as a one-way proposition, with the Bureau being placed in the position where it can have only what the association says it should have and not what it feels it needs for its own use. . . . I frankly cannot continue in the uncomfortable position I find myself in of warding off questions concerning our automobile figures." Lubin continued to press the matter, and it was finally resolved in late 1937, when the Manufacturers Committee of the Automobile Manufacturers Association authorized the forwarding of individual reports to the Bureau.[36]

Lubin was constantly concerned with the press' understanding of the Bureau's work, and with stressing clarity and style in the presentation of Bureau data. A critical editorial on the style of a Bureau press release resulted in the formulation of principles to ensure effective use of Bureau reports. These guidelines included: "Ideally, (a) technically competent persons should always be able to detect from the record any possible shortcomings in our work, and (b) others who follow us should be able to determine from the printed record exactly what we have done."[37]

Economic analysis stressed

Lubin's interests in labor economics in an institutional setting, and in related areas such as industrial prices, unemployment, and social security, were actively pursued throughout his direction of BLS. His emphasis on analysis along with the improvement and extension of the Bureau's statistical programs was apparent in his activities and public statements. He was called upon to represent the Bureau, the Department of Labor, or both, in a number of landmark Congressional hearings. Lubin would make statistical presentations that went to the heart of the matter and would draw on his extensive experience and perception to comment on the policy questions involved. His ready, direct, and stimulating responses raised no doubt about his objectivity and impartiality. Nor was there ever any question regarding his political independence as Commissioner.

Several basic themes were apparent in Lubin's public expressions during his commissionership. Shortly after his appointment, while he was not in sympathy with the price-fixing and production-restricting aspects of the National Industrial Recovery Act, he found important justification in it based on the single maxim, that the welfare and profits of no private business shall interfere with the welfare of the nation as a whole. . . . With NRA setting the rules for industry, competition was not eliminated, and "employers with a social conscience are assured that they will no longer be compelled to conform to the standards of competitors with blunted social sensibilities," Lubin said. Further, he saw the greatest contribution of NIRA to social progress as lying "in the guarantee it gives workers to organize and bargain collectively through representatives of their own choosing."[38]

Complementary was his view that underconsumption resulting from inequitable distribution of income in the 1920's had been a major contributory factor in the Great Depression. These views were expressed in his testimony at the hearings on the Fair Labor Standards Bill in 1937 and in his extensive presentation in opening the Temporary National Economic Committee hearings in 1938.

Calling attention to the evidence of the consumer expenditure survey of 1936–37, that 54 percent of the 29 million families in the United States, had incomes below $1,250 per year, Lubin said, "A more equitable distribution of income is more than an ethical problem. . . . To me it is a problem of keeping the gears of the economic machine constantly in mesh."[39]

Lubin and the Bureau staff were prominent in the work of the Temporary National Economic Committee (TNEC) from 1938 to 1941. Lubin was designated as the Department of Labor representative, with A. Ford Hinrichs as alternate. Lubin played a major role in planning the work of the committee, and as analyst of trends utilizing data and analyses prepared by the Bureau staff and occasional outside consultants. He made recommendations to the committee as an expert labor economist representing the Department of Labor. Aryness Joy directed the Bureau's staff work for the TNEC, which included the preparation of monographs reflecting analytical and case study approaches Lubin had viewed as essential to the role of the Bureau.

The economic climate changed with the defense preparations underway after the start of World War II. The TNEC hearings and Lubin's periodic testimony in 1939 and 1940 reflected the new circumstances. But again, the basic concerns in Lubin's ideas were reformulated in order to set long-term goals which drew on past experience and continuing socioeconomic trends. In an incisive analysis of the factors affecting the productivity of labor, he pointed out that the effects of technological change would be moderated as the economy absorbed more employees. Calling attention to the costs directly borne by displaced workers, in contrast to the tax treatment of obsolescence of machinery, he urged the committee "to give consideration to the feasibility of a compulsory dismissal wage to be tied up in some way or other with the unemployment insurance system."[40]

Lubin, who had been the leadoff witness at the TNEC hearings in 1938, was also one of the final witnesses appearing in March 1941. He was now an official of the Office of Production Management, as well as a member of the TNEC and a representative of the Department of Labor/Bureau of Labor Statistics. He pointed to the major changes which had occurred between 1932, and even between 1938, and 1941: "In 1941 we are strong. In 1932 our morale was pitifully low. The assumption of responsibility for the welfare of individual citizens by the Government in the intervening years has been partly responsible for this change." He urged the TNEC to sift out the practical aspects of the problems presented, to formulate a program to ensure "that never again does a catastrophe occur like that which overwhelmed us in the 1930's. . . . "—a program fitting, "into our traditions of private enterprise and private ownership."[41]

The war years

Lubin's full-time direction of the Bureau came to an end in June 1940, although he remained as Commissioner on leave until January 1946. On June 15, 1940, Perkins announced that at the request of Sidney Hillman of the National Defense Committee, Lubin had been assigned to serve as an assistant to Hillman, but was to retain his position as Commissioner. In a memorandum to A. Ford Hinrichs, designated as Acting Commissioner, Lubin stated, "In general you are authorized on your own responsibility and without reference to me to represent the Bureau of Labor Statistics in any matters which may arise and to make any decisions that may be necessary either with reference to policy or internal administration." However, he would continue to be available to Hinrichs "on all matters of fundamental policy."[42]

The next year, President Roosevelt called for Lubin's assignment to the White House. On May 12, 1941, Perkins wrote to Roosevelt that: "I am very glad to comply with your request to assign to your office and for your assistance Mr. Isador Lubin . . . while Mr. Lubin will, I know, give you great assistance, his entire staff in the Department of Labor will be at his disposal to assist him in the inquiries he will make for you."[43]

There were continuing calls for advice from Lubin by Perkins during the war years. She called upon him for his views on coordinating the activities of the BLS with those of the Bureau of Employment Security in the War Manpower Administration. His response was to oppose any intimation of the possibility of the transfer of any work from BLS.[44] He was also called upon for planning in connection with the ILO Conference in Philadelphia in 1944.

Lubin's White House assignments as economic and statistical adviser were varied. Immediately, he was involved in analyzing the economic effects of shifts in production to lend-lease requirements, and in discussions relating to economic stabilization. He went to London temporarily to assist W. Averill Harriman, coordinator of U.S. supplies to Britain. In March 1945, he was designated associate U.S. representative on the Allied Commission on Reparations, and spent much time examining conditions abroad at the end of the war.[45]

Lubin resigns as Commissioner

Giving personal obligations as his reasons for leaving public service, Lubin resigned in January 1946. (Perkins had resigned as Secretary of Labor in 1945.) President Harry S. Truman accepted his resignation as Commissioner of Labor Statistics, but stated that he would continue to regard him "as a public servant whom I shall feel free to call upon whenever the occasion warrants. . . . For 13 years you have without hesitation given of your time and energy to the service of your government. You built up the Bureau of Labor Statistics into an institution that has commanded the respect of all recognized leaders in the field of economics and statistical science, as well as of labor and management throughout the country."[46]

Lubin expressed his own assessment of the role of the Bureau on the occasion of the Bureau's 70th anniversary in 1954. He observed that the "Bureau's data have always played an important part in the formulation of Federal policy," reinforcing the constant recognition by the Bureau of the need for continuing "improvements in collection procedures and technical standards and in willingness to have its work periodically reviewed." But he expressed concern for the need for continued emphasis "of the considered analytical studies which have marked its work in the past."[47]

In 1966, Lubin wrote a eulogy for David Saposs, in honor of his 80th birthday. The eulogy is equally applicable to Lubin: "Everything that he has undertaken to do he has done with real distinction. His interest in the various fields in which he has been engaged has not been that of an intellectual. It has been the outgrowth of a deep feeling for needs of mankind and the conviction that things could be improved in this world of ours."[48] ☐

Frances Perkins' interest in a new deal for blacks

The black-oriented programs of the Nation's first female Cabinet member may seem modest by today's standards; however, in her time she was a pioneer, who made the welfare of blacks a priority of the Department of Labor

HENRY P. GUZDA

As Secretary of Labor from 1933 to 1945, Frances Perkins adhered to the principles of equality for all. A former social worker, Perkins conceived the Department of Labor to be the listening post for the Government, "the place where the poor people of the Nation could come with their complaints and obtain assistance."[1]

She made it quite clear that no one would be denied assistance because of race, creed, or religion. Blacks, in particular, needed help during the Depression, and Perkins offered assistance, although critics claimed her programs were simple tokenism. Yet, as one author stated, "It was all tokenism, perhaps, but blacks hadn't been able to get even tokens in the past."

By making social welfare the No. 1 priority of the Department of Labor, Perkins ran afoul of traditional values. Her appointment, by the nature of her sex, was opposed by many labor leaders who viewed the Labor Department as their own.

Of President Franklin D. Roosevelt's circle of advisers, Perkins was not the only member considered a champion of black causes. Black leaders also turned to Works Project Administrator Harry Hopkins and Secretary of Interior Harold Ickes. Together, this troika would often pool its efforts to advance the social progress of blacks, calling on Eleanor Roosevelt for additional help.[2]

First experience—a lasting one

The social awakening of Frances Perkins began when, as a student at Mount Holyoke College, she visited the grimy factories that dotted the landscape of the Connecticut River Valley. Another strong impact was Jacob Riis's exposé of urban slum life in *How the Other Half Lives.*[3] Riis's descriptions and photographs seared Perkins' imagination, and throughout her life the impact of that book remained.

As a young social worker, she dealt directly with poor blacks for the first time when she secured a job with the Philadelphia Research and Protective Association. Both immigrant and black girls traveled to Philadelphia searching for employment in the booming city. They were met at the boat piers or railroad terminals by unsavory agents who offered them lodging and employment as prostitutes. The Philadelphia Protective Association assigned Perkins and two black assistants to meet the new arrivals and direct them to reputable boardinghouses and employment agencies. Perkins was instrumental in the closing down of several of the disruptable agencies. City officials, drawing upon recommendations from the Protective Association, eventually required licensing for lodging houses.[4]

'New deal' or raw deal?

"Will the New Deal be a Square Deal for the Negro?" asked Jesse Thomas, a field representative for

---

Henry P. Guzda is a historian in the U.S. Department of Labor.

the National Urban League. Would President Roosevelt simply pay lip service to blacks and ignore them after the elections? Black leaders had every right to be skeptical about the "New Deal." Roosevelt had served under President Woodrow Wilson and Navy Secretary Josephus Daniels in the early 1900's "with no visible discomfort," and both men were segregationists. And, as governor of New York, Roosevelt demonstrated little interest in civil rights.

Civil rights leaders, however, had no doubts about Perkins, his choice for Secretary of Labor. Oswald Garrison Villard, former executive secretary of the National Association for the Advancement of Colored People, said, "When I think of Frances Perkins' point of view, it seems to me that she will be an angel at the Cabinet table. . . ."[5] Will Alexander, a respected white civil rights leader from the South, commented that Perkins was committed to the principle that black Americans had the right to all the opportunities enjoyed by other Americans.[6]

If there were any doubts concerning Perkins' position on equal rights, they quickly dissipated. Soon after taking office, the Secretary received complaints from some Southern white employees that black clerical workers were eating lunch in the "whites only" cafeteria. The previous policy kept facilities segregated under the guise that one was for blue-collar workers and manual laborers and one was for white-collar workers. Perkins replied that the black clerks were white-collar workers, and therefore, violated no rules by eating where they did. Shortly afterwards, she abolished dual facilities altogether.

One of the reasons behind this incident was the increase in employment of blacks at the department. Previously, blacks, with few exceptions, worked as messengers, custodians, and in similar positions. Between 1933 and 1936, however, the department added 129 black employees, many in clerical positions.

Perkins revived the U.S. Employment Service and added 78 blacks there. She insisted that the U.S. Employment Service treat all citizens with impartiality regardless of race, color, or creed. In States with a high percentage of blacks in the population, she saw to it that blacks were represented on the U.S. Employment Service staff. The special Negro Placement Service in the employment offices surveyed the conditions of blacks and the prevailing racial attitudes of the local community. U.S. Employment Service officials used the data to determine the size and movement of the local black population, and the available job opportunities.[7] Progress came slowly, and while the number of appointments and placements left much to be desired, it was a beginning.

During the Depression, many employers fired black workers, replacing them with whites. At the Labor Department, several black elevator operators told Secretary Perkins of their impending dismissal to create jobs for unemployed whites. (Perkins knew some of the operators personally, because she used the public elevators, rather than her private one.) She ordered the building contractor to keep the black operators, arguing that blacks had held those jobs since the 1920's when no one else wanted them.[8]

Integrating cafeterias and protecting the job security of elevator operators were noble gestures, but they did little to help the majority of black Americans. Blacks suffered particularly hard during the Depression. The National Urban League said that black unemployment was 30 to 60 percent greater than white unemployment. The Government did not systematically collect statistics on joblessness for any group until about 1940, but the Bureau of Labor Statistics estimated that in 1933, the worst year of the Depression, about 25 to 35 percent of the civilian labor force was out of work.

Black leaders petitioned their friends in Washington, including Eleanor Roosevelt, Secretary of the Interior Ickes, and Labor Secretary Perkins, to initiate special programs for destitute black Americans. Ickes appointed Clark Foreman, a white civil rights leader, as Adviser for Negro Relations to the Interior Department; however, Foreman acted as adviser to the entire executive branch.

At Foreman's suggestion, Frances Perkins regarded the welfare of the black worker as special to the Labor Department: she appointed her own adviser for Negro affairs, took steps to study the problems of black workers, and arranged for employment bureaus for blacks. The Women's Bureau gave special attention to black women workers and, similarly, the Children's Bureau became concerned with black child labor.

Perkins once stated that one of the best ways to protect the interest of the workers needing the most protection was to "look, see, and report."[9] By publicizing the facts of discrimination against blacks, she hoped to stimulate reform. The Bureau of Labor Statistics reported the proceedings of an immense conference of civil rights leaders and their recommendations on solving black unemployment problems and also published the findings of Robert Weaver, the highest ranking black in the Government, which refuted the theories that the overrepresentation of blacks on the relief roles was from a lack of initiative or innate inferiority.

Other studies conducted by the Department of Labor corroborated Weaver's findings. With unemployment so high, white workers accepted jobs which paid marginal wages, often replacing black workers. The department also found that very few blacks worked in the skilled trades because union locals barred them and controlled apprenticeship for entry into the trades. When the government passed legislation beneficial to organized labor, it often penalized those few blacks in the skilled trades because the majority of a craft or class determined representation. In addition, Labor Department researchers found that 25 percent of all employed blacks worked as domestics and, as the Depression worsened and strained everyone's budget, were among the first to lose their jobs.[10]

Division of Negro Labor. Black leaders had been urging the Secretary of Labor to appoint an adviser to coordinate activities in the department that dealt with the special problems of Negro labor. Assistant Secretary Edward McGrady represented Perkins at several conferences on Negro labor. She appointed another white, George Arthur of the Rosenwald Foundation (a civil rights organization), to the National Advisory Committee of the U.S. Employment Service. Perkins also established a committee, composed of the chiefs of the Women's Bureau, Children's Bureau, and the Bureau of Labor Statistics, to study how the Government could improve the health and welfare of blacks. These actions did not appease civil rights groups; they wanted a member of their own race to represent them in the Department.

Early in 1934, Perkins appointed Lawrence Oxley, a commissioner of conciliation for the department, as director of the newly formed Division of Negro Labor. The Division of Negro Labor functioned as Perkins' personal advisory agency on the problems of black workers. Oxley was responsible for coordinating the activities of the various bureaus which were concerned with blacks, and representing the Secretary in all labor affairs concerning blacks. The Division of Negro Labor was a remnant of the Division of Negro Economics, set up by Secretary of Labor William B. Wilson to handle interracial manpower problems during World War I. (Wilson had tried to make the Division of Negro Economics permanent, but Southern congressmen refused to appropriate funds.) A major difference between the two was that the Division of Negro Labor commissioner had some influence in alleviating unemployment of blacks through use of the U.S. Employment Service. (Oxley was made an adviser to the director of the U.S. Employment Service.)

Public construction projects. A landmark program cosponsored by the Departments of the Interior and Labor provided employment for black workers in Public Works Administration (PWA) projects. Local PWA administrators and U.S. Employment Service agents set aside a percentage of funds to hire black workers on public construction projects in areas predominantly populated by blacks. (In the early 1970's, such programs—the Philadelphia Plan, for one—would be hailed as a major innovation in the promotion of equal employment opportunity.)

Organized labor approached the arrangement with less than enthusiasm. The Washington Building Trades Council argued against using nonunion labor on public construction projects. Lawrence Oxley countered that few blacks belonged to unions and that despite the affirmation of the American Federation of Labor to erase the color line, many local trade organizations still debarred blacks. The Department of Labor ordered U.S. Employment Service agents to secure work permits for unaffiliated black workers to ensure them representation on construction projects. Several projects failed to meet the obligation of such arrangements, but most sites complied.

The blue eagle strikes

The National Recovery Administration (NRA) brought hopes of a new era for most Americans. The NRA suspended antitrust laws so that industries could agree on "fair trade" codes intended to lessen competition and raise wages; recognized labor's right to bargain for workers; and got employers to agree to a 35- to 40-hour workweek and to pay minimum wages of $12 to $15 a week. Establishments adhering to these codes displayed a blue eagle, the NRA symbol.

Black Americans, at first, rallied around the blue eagle, little realizing that for some of them it was about to become a bird of prey. The black press called the program "a lifesaver to the colored American." New Dealers thought stimulation of the economy by consumer purchasing power was a key to ending the Depression and that the NRA would provide that stimulus.

In a short time, black leaders began to see the NRA in less glowing tones. Southern employers were using the codes to replace blacks with whites or were writing new codes which allowed a regional differential by which workers in the South would receive considerably less than workers in the North. (Most of the time these were racial, rather than geographical, differentials.) Southern employers defended their discriminatory differentials, saying that blacks in the South traditionally received lower wages because they were inefficient and innately lazy, and that if there were no differentials, they would have to replace their black workers with white ones.

When Perkins testified before Congress on the National Recovery Administration, it was clear her sympathies were with the blacks. The purpose of the NRA, she stated while testifying before a hearing on "fair trade" codes in the iron and steel industry, was to revive the purchasing power of the wage earners. Supplied with information gathered by Oxley, she argued that regional wage differentials should be dictated by the cost of living. "The low rates for the Southern districts are presumably based on the predominance of Negro labor in those districts," she said, "but Negroes are also consumers. Their cost of living is not lower than the living costs of the whites; it is rather that they live differently on a lower standard."[11] The codes for the steel industry on a racial basis were denied, and instead a geographical differential was adopted for all workers.

Southern employers appealed for special exemptions, arguing that obsolete and inefficient plants would be closed if they had to pay blacks at the same level as whites. Perkins ordered an investigation into one of the most publicized cases, that of the Southland Manufacturing Co. The 300 blacks employed at the plant were paid $9 a week. Company executives told the appeals board that they could not operate if they had to pay the extra $3 a week as prescribed in the codes. However, investigators found no legitimate reason for an exemption, and the board ordered Southland to pay $6,100 in back wages. Three months later, Southland's parent company, Reliance Manufacturing, closed the plant.

The NRA investigated the case. The president of Reliance Manufacturing claimed that the plant had operated in the red, "on account of the characteristics of the people who have not had the experience and background, and their racial characteristics."[12]

Perkins assigned Esther Peterson of the Women's Bureau to work with Oxley on obtaining the facts on Southland. They found that other Reliance Manufacturing plants had records no better than Southland, that the Southland plant had a notoriously long record of using convict labor, operating under sweatshop conditions, and employing blacks to keep out organized labor, and that the assertions of Negro inefficiency were false. They also provided figures showing that the Southland plant did not operate in the red and that it made a profit.[13] The NRA denied the exemptions for a second time. Black leaders and Perkins breathed easier, but 300 blacks had lost their jobs. And, in many areas throughout the South, blacks lost their jobs because employers refused to pay them the same wages as whites.

Stepping stone for young men

One of the most disturbing problems of the Depression was unemployed youth. After Roosevelt took office, he sought to harness some of that young manpower and at the same time refurbish the Nation's eroded and scarred landscapes. Frances Perkins testified in favor of his plan before Congress. It passed, and the Civilian Conservation Corps was born.

The administration of the corps was interdepartmental. The Deparment of Labor selected the young men for the program through the U.S. Employment Service; the War Department fed, clothed, housed, and conditioned them; and the Agriculture and Interior Departments chose the work projects. The young men lived in camps and planted trees in virtually every section of the country. They received $1 a day, a good portion of which went home to their parents.

Oscar De Priest, the only black congressman, had attached a rider to the bill which stated "that no discrimination shall be made on account of race, color, or creed." However, selection of young men for the corps had barely started, when Perkins received complaints from civil rights leaders that in many sections of the South, U.S. Employment Service agents were excluding blacks from the Civilian Conservation Corps.

Among the most flagrant discriminators were agencies in the State of Georgia. And, it was only after Perkins threatened to suspend the program for the entire State, that Georgia Governor Eugene Talmadge unenthusiastically agreed to enroll blacks.

But Georgia violated the agreement frequently, and U.S. Employment Service Director Edward Persons wanted to suspend Civilian Conservation Corps activities in the State. He drafted a letter to that effect, but Perkins discouraged him from sending it to Talmadge. She knew that the President needed the support of Southern politicians for many of his programs and would not embarrass Roosevelt if she could help it.[14]

The Department of Labor experienced similar difficulties in other Southern States, though never so major as in Georgia. Persons succeeded in persuading many areas to enroll blacks, although not as many as he felt was justified. Alabama, for example, placed 776 Negroes, the highest number, while Mississippi, with the largest population of blacks in the South, placed only 46.

A critical point for the Civilian Conservation Corps came in the summer of 1935 when unrest among white communities over black camps reached a tender stage. California, Arkansas, and, especially, Texas wanted a halt in black placements. Civilian Conservation Corps Director Robert Fechner told Persons that the situation in Texas posed a special problem and that suspension of black enrollment might be a good idea. Persons adamantly opposed suspension, and wrote to Perkins,

> The CCC has never adequately fulfilled its opportunities for the selection of colored enrollees. For us now to expressly deny the right would be an indefensible procedure.

Perkins agreed that the black camps should not be suspended. However, President Roosevelt perused the reports submitted by both sides and termed the situation "political dynamite,"[15] and the Department of Labor bowed to political pressure.

Even the harshest critics of the New Deal admitted that blacks benefited from the Civilian Conservation Corps. Of the 2.5 million men enrolled during its 9 years of existence, 200,000 were black. Almost 87 percent of the black enrollees participated in an education program. And, while the education they received did not open all the doors of opportunity, it was a forward step.

Colorblind assistance

Perkins had lobbied long and hard for passage of the Social Security Act of 1935 and was disappointed that the Department of Labor did not administer all its provisions. The act grew out of the many changes in the American experience. It set up bulwarks against new kinds of economic insecurity which threatened Americans during the Depression. The act protected people who were too young or too old or were physically handicapped. It authorized Federal grants to enable States to broaden and extend regular allowances for needy mothers, the blind, and the aged. It also provided grants for child welfare, crippled children, and physically handicapped people with potential for useful work. The provisions for child welfare were especially beneficial in rural areas of the South, where a good number of the children were black.

THE BLACK-ORIENTED PROGRAMS and policies initiated under Perkins' direction seem modest by today's standards. The fact that she would forgo her social beliefs to protect the President from political embarrassment might seem hypocritical. But, the programs she started left a legacy for programs of the 1960's and 1970's. ☐

Establishing a reputation

When Al Smith became Governor of New York in 1918, he appointed Frances Perkins to the State Industrial Commission despite strong opposition from manufacturers' associations. Smith's confidence was quickly rewarded when, in 1919, he sent her to mediate a violent strike of copper mill workers in Rome, N.Y. On arriving, she found troops patrolling the city's streets. After talking with representatives of labor, business, and the community, Perkins advised that a public hearing be held before the State Industrial Commission. She firmly believed in the persuasive power of public opinion, and the subsequent hearings quickly led to direct negotiations and a settlement of the strike. The workers gained higher wages and union recognition; Frances Perkins gained a reputation. Manufacturers who had complained when Smith sent a woman to deal with a labor problem sent word after the strike: "Do us a favor and ask the Governor where he got that woman."

Changes in unemployment insurance legislation during 1979

Concern for financing of unemployment insurance payments was evident in 1979; changes generally involved extending disqualification periods, restricting eligibility, and increasing tax rates

VIRGINIA A. CHUPP

No major Federal unemployment insurance legislation was enacted in 1979. However, Congress did extend the National Commission on Unemployment Compensation for an additional 6 months. The Commission, created under the Unemployment Compensation Amendments of 1976, is to examine the unemployment insurance program and make recommendations for changes. A report is due by July 1.

Most of the amendments in unemployment compensation undertaken by State legislatures during the year were designed to provide financial backing for programs. Several notable trends emerge from a State-by-State analysis of changes: increasing eligibility requirements, tightening disqualifications, and revision of tax schedules to produce additional income for unemployment insurance funds.

Benefits and requirements

Fewer claimants may be eligible for benefits in 1980 because of the increased amount of high-quarter or base-period wages needed to qualify. For example, Arizona, New Hampshire and South Dakota increased the amount of high-quarter wages a claimant needs to qualify for benefits. In Arizona, $625 is needed ($725 in August), up from $375 last year; New Hampshire requires $600 in two high quarters (formerly $300) and South Dakota, $600 (formerly $400). To qualify for benefits in Iowa, a claimant's base-year wages must be 1-1/4 times his or her high-quarter wage; in Maine, base-period wages must double the State's annual average weekly wage; and in Montana, a claimant must have worked 20 weeks or more, averaging $50 weekly.

Maximum weekly benefits increased in only eight States:

	Old maximum	*New maximum*
Arizona	$85	$90
Mississippi	80	90
Florida	82	95
Missouri	85	105
Nebraska	60	106
New Hampshire	102	114
Tennessee	95	100
Virginia	115	122

Changes in eligibility and disqualifications provisions tended to be toward more restrictive requirements for claimants to meet in order to collect benefits. North Dakota, South Dakota, Montana, and Nevada amended their laws to require strictly duration disqualifications for the three major causes: voluntarily leaving work without good cause, refusal of suitable work, and discharge for misconduct. Under such a disqualification, a claimant is denied benefits for the duration of the unemployment, and until he or she earns a specified amount of wages in subsequent work. In addition, two States, Maryland and North Dakota, now restrict good cause for leaving work to that attributable to the work or the employer, and no longer recognize good personal cause.

Virginia A. Chupp is an unemployment insurance program specialist in the Employment and Training Administration, U.S. Department of Labor.

In Iowa, Maine, and Montana, and definition of "suitable work" now changes, by law, with the length of a claimant's unemployment. Previously, "suitable work" was redefined by a procedure or regulation.

Generally, States are changing fraud from a penalty specified in the State's unemployment insurance law to a criminal act, punishable under the State's penal code. Six States made such changes in 1979.

Following is a summary of some significant changes in State unemployment insurance laws in 1979:

Arizona amended its benefit charging provisions so that benefits paid subsequent to a labor dispute will not be charged to a base-period employer, if the payment is a result of the labor dispute.

Arkansas lifted the disqualification for quitting work to attend school or become self-employed, although the individual must continue to meet the able-to-work and available-for-work requirements. The voluntary quit disqualification no longer applies if the claimant had a leave of absence because of pregnancy and was not rehired after the termination of the pregnancy. However, pregnancy is among the nondisqualifying causes for leaving work if the claimant made reasonable efforts to preserve her job rights.

California changed the time for which temporary disability insurance benefits can be paid on account of pregnancy from a period of 3 weeks before and 3 weeks after childbirth to any 6-week period during the pregnancy.

Colorado will use average earnings in all industries covered by the law, rather than selected ones, in computing the State maximum weekly benefit amount. Full benefits will be allowed if the worker quits because of harassment by the employer, not related to job performance. Pension payments will not be deducted from the claimant's weekly benefit if the pension payment is made in a lump sum comprising only contributions made by the claimant.

The following were added to the list of reasons for disqualification or reduced award: excessive tardiness or absenteeism; sleeping or loafing on the job; failure to meet established job standards for reasons other than inability to do the work; and voluntarily quitting work for unknown reasons or for personal reasons.

A seasonal industry was redefined to include an industry customarily operating for 25 (formerly 24) weeks or less in a year.

Connecticut's claimants who received benefits to which they were not entitled, even though not because of fraud, are liable to repay those benefits or have them deducted from future benefits. However, deductions may not exceed half of an individual's weekly benefit.

Because of experiences in the winter of 1979, the law was amended so that employers are not charged for benefits resulting from damage to a place of employment caused by severe weather conditions. The maximum disqualification for fraud was increased from 20 to 39 weeks following the offense.

Delaware's maximum tax rate increased from 3.0 to 5.0 percent of employer's payroll. The period in which an employer's account must be chargeable before he or she can qualify for other than the standard 2.7-percent rate was reduced from 4 to 3 years.

Florida limited the maximum tax rate to 0.1 percent a year. To be charged for benefits, an employer must pay at least $100 (formerly $40) in base-period wages.

The disqualification period for the three major causes was changed from the duration of the unemployment and until the worker earns 10 times the weekly benefit amount to duration plus earnings of 17 times the weekly benefit. A disqualification was added for discharges for gross misconduct if the worker was terminated for violation of a criminal law punishable by imprisonment, or for any dishonest act. The disqualification period continues for up to 52 weeks or until the individual is reemployed and earns 10 times the weekly benefit amount. Also, disqualifying income now includes retirement payments made for service in the U.S. Armed Forces.

Hawaii changed the penalty for fraud from a fine of up to $200 or 30 days' imprisonment, or both, to either a misdemeanor or a felony under the State criminal code.

Idaho's provision denying benefits to school personnel between school years or terms now applies only to those wages earned for work performed for educational institutions.

Indiana will deny benefits to temporary employees of the General Assembly or of a legislative committee who work between legislative sessions only.

Iowa has dramatically changed its benefit system. An individual's weekly benefit amount will be computed, in steps, at 1/19 to 1/23 of the high-quarter wages up to 58 to 70 percent of the State average weekly wage, depending on the number of dependents claimed by the worker. In addition, the proportion of base-period wages used to compute the duration of benefits was reduced from one-half to one-third and maximum duration was reduced from 39 to 26 weeks. Base-year wages of 1-1/4 times the high-quarter wages are needed to qualify for benefits, in addition to the previous requirement of $400 in the highest quarter and $200 in a quarter outside the high quarter.

The amount of benefit charges to a succeeding employer's account is limited to those based on wages earned with that employer and, if the claimant remains unemployed 10 weeks after those wage credits have been charged, any benefits paid after the 10 weeks.

All three of the major causes of disqualifications were amended. Disqualification for any of the three causes now continues for the duration of the claimant's unemployment and until he or she has earned wages in covered work equal to 10 times the weekly benefit amount. In addition, discharge for gross misconduct will result in a cancellation of all wage credits earned prior to discharge.

Work is considered suitable if the weekly wage offered bears the following relationship to the claimant's high-quarter weekly wage: (1) during the first 5 weeks of unemployment, 100 percent; (2) from the 6th through the 12th week; 75 percent; (3) from the 13th through the 18th week, 70 percent; (4) after the 18th week, 65 percent. However, no individual is required to accept a job paying less than the Federal minimum wage.

Kansas increased the percentage of highest quarter earnings used to determine weekly benefits from 4 to 4.25 percent. The maximum contribution rate remains at 6.6 percent for 1980, but will increase to 3.8 percent for 1981 and 1982, and to 4.0 percent in 1983 and subsequent years. In addition, a new maximum rate of up to 4.3 percent can be implemented under certain conditions.

Maine's claimants must meet these requirements to be eligible for benefits: (1) wages must equal twice the State's annual average weekly wage in each of two quarters in the base year, and (2) total base-year wages must equal 7 times the State annual average weekly wage.

The suitable work definition was amended to disregard prior earnings if an individual has been unemployed for 12 consecutive weeks and the work offered pays wages at least equal to the State's average weekly wage. Services of certain musicians are excluded, if they are performed under terms of a contract between the musicians and the employer.

Maryland changed its voluntary leaving provision so that only a cause directly attributable to or connected with the work will be considered good cause for leaving work. The period in which prosecution may be brought for fraud in connection with the collection of benefits was extended from 2 to 3 years. A claimant's current employer will not be charged for benefits paid for unemployment caused by a shutdown for retooling; instead, the employer causing the shutdown will be charged.

Michigan preserved an individual's right to receive benefits during continuous involuntary disability if the claimant submits a timely request for such preservation. Benefits are not payable after 156 weeks after the beginning of the claimant's benefit year.

Minnesota changed it disqualifications for voluntary leaving and discharge for misconduct to exclude separations because of completion of an apprenticeship program or terminations occurring after the employee gave notice of intent to quit work. The latter continues only through the week of the intended termination. Benefits cannot be paid for any week in which the individual received a salary equal to his weekly benefit.

An individual will not be disqualified for any acts occurring after separation from employment. The penalty for disqualification because of fraud will expire 104 weeks after the week in which the fraud determination was made.

Benefits paid after an individual fails, without good cause, to accept an offer of reemployment will not be charged to the employer if the refusal was due to the distance of the work from the claimant's residence, serious illness, or the claimant's other employment at the time of the offer.

Mississippi law was amended to increase the standard and the maximum contribution rate from 2.7 to 4.0 percent and the minimum rate from 0 to 0.1 percent. Also benefits will not be charged to an employer's account if paid after an employee is fired before a 90-day trial work period because he or she is unable to perform the work.

Service performed as a "sitter" at a hospital is excluded from coverage if the "sitter" is employed by the individual.

Missouri decreased slightly the percentage of highest quarter earnings used to determine the weekly benefit amount. The taxable wage base will increase from $6,000 to $6,600 if, during the preceding year, the balance in the unemployment compensation fund dropped below $125 million. The maximum tax rate was increased from 4.1 to 6.0 percent, and the fund balance triggers that determine the rate schedule were changed from a percentage of payrolls to a cash balance requirement.

The maximum period of disqualification for a misconduct discharge was increased from 8 to 16 weeks. An individual will not be disqualified for voluntary leaving if he or she retired pursuant to a contract between the employer and a duly-elected union.

Montana claimants must have at least 20 weeks of work at an average weekly wage of $50 to qualify for benefits, effective July 1, 1980. At the same time, minimum weekly benefits will change from $12 to an amount equal to 15 percent of the State's average weekly wage and weekly benefits will be computed at 50 percent of an individual's average weekly wage, up to the maximum which is currently computed at 60 percent of the State's average weekly wage. The period for which benefits are payable was reduced from 12 to 8 weeks.

The taxable wage base increased from $6,000 to $7,400 for 1979 and, beginning in 1980, will be recomputed annually at 75 percent of the State's average annual wage. The minimum contribution rate was decreased from 0.5 to 0.2 percent, and the maximum rate was increased from 3.1 to 4.4 percent.

The experience rating system, used to determine an employer's rate, was changed from a system which measures the decline in an employer's annual payroll to a system which uses all factors—benefits, contributions, and the employer's payroll.

Excluded from coverage is casual labor not in the course of the employer's trade or business, unless the quarterly wages paid are $50 or more and the service is not done by a regular employee hired specifically for those services.

The voluntary leaving disqualification will continue for the duration of an individual's unemployment and until he or she earns 6 (formerly 4) times the weekly benefit amount. The requirement which permitted requalification for benefits after 7 weeks of otherwise compensable unemployment was repealed. However, the law now permits purging the disqualification if the individual regularly attends an accredited school for at least 3 consecutive months.

Claimants discharged for misconduct will now be disqualified for the duration of their unemployment and until they earn 8 (formerly 6) times the weekly benefit amount. Here, too, the alternative requirement permitting benefits to be paid after the claimant has served 8 otherwise compensable weeks of unemployment was repealed.

Suitable work was redefined: for the first 13 weeks of unemployment, suitable work is that which meets the criteria established by law and that which offers the areawide prevailing wage for the claimant's customary occupation; after 13 weeks, suitable work will include work that offers 75 percent of the prevailing wage.

The benefit charging provisions were amended to specify that no employer's account will be charged for Federal-State extended benefits, or for benefits paid to an individual who voluntarily left work without good cause or was discharged for misconduct.

Nevada tightened disqualification for misconduct discharges from a variable period with no earnings required to the duration of claimant's unemployment and until the claimant earns the weekly benefit amount in each of 1 to 15 weeks.

New Hampshire extended coverage to certain local government employees and enacted legislation denying benefits to school personnel between terms, professional athletes between seasons, and certain aliens. In addition, a new disqualification applies to an individual who leaves self-employment and will continue until the claimant earns wages in each of 3 weeks equal to 120 percent of the weekly benefit amount.

The provision was repealed which prohibited application of the labor dispute disqualification if the stoppage of work is due to a lockout or the employer's failure to live up to an employment contract. However, the labor dispute disqualification will not apply if the claimant became unemployed and entitled to benefits prior to the dispute and his or her connection with the employer has been totally severed.

Disqualification for disciplinary layoff now applies for the life of the layoff. A lump sum payment (other than accrued vacation pay) from an employer going out of business now affects a claimant's eligibility for benefits.

New Mexico decreased the maximum number of weeks in a year that benefits can be paid from 30 to 26. The circumstances under which a labor dispute disqualification will be imposed were changed from a work stoppage existing because of the dispute to a labor dispute in progress at the claimant's place of employment.

North Carolina amended its fraud penalty so that instead of a fine or jail or both, the individual is guilty of a misdemeanor. Also, the time needed to qualify for experience rating is no longer limited to 12 months.

North Dakota changed from a minimum weekly benefit amount of $15 to a flexible minimum computed annually in July at 18 percent of the State average weekly wage. This change results in a flexible qualifying requirement because the State requires wages in two quarters and 40 times the weekly benefit amount to qualify for benefits. Minimum duration of benefits was reduced from 18 to 12 weeks and the computation of duration is no longer based on the relationship of base-period wages and weekly benefits but is based on the ratio of base-year wages to high quarter wages.

The wage base is now computed at 70 percent of the State's average annual wage for the 12 months ending June 30. Formerly, this computation occurred only if the fund balance failed to meet a specified level and the amount of the increase in the wage base was limited to $100 in any year. The maximum contribution rate increased from 4.2 percent of the employer's total payroll to 6.0 percent and the minimum rate from 0.2 to 0.3 percent. The method of determining fund requirements for triggering rate schedules was changed from a percentage of payrolls to a multiple of the highest benefit cost in 1 of the preceding 5 years.

An individual's weekly benefit will be reduced by half the amount of the pension he or she receives if at least half the cost of the pension was provided by a base-period or chargeable employer, and by the entire cost of the pension if the pension was wholly financed by such an employer.

Only a cause directly attributable to the employer is considered a good reason for voluntarily leaving work. In addition, the period of disqualification for voluntary leaving was reduced from the duration of the claimant's unemployment and until he or she earned 10 times the weekly benefit amount to duration plus 5 times the weekly benefit amount.

The alternative requalifying requirement was deleted for those claimants denied benefits because of one or more of the three major causes of disqualifications.

Oregon law now specifies that individuals claiming benefits must submit information regarding qualifications, training, and experience if requested to do so by the State employment service.

Rhode Island's taxable wage base will be determined as 70 percent of the State's average annual wage in covered employment during the preceding year. In addition, the minimum contribution rate was increased from a range of 1.0-3.0 percent to 3.0 percent and the maximum rate was increased from 4.0 percent to 6.0 percent. Employers are required to pay a balancing tax, ranging from 0.7 percent to 1.5 percent, depending on the tax schedule in effect in a year. In addition, the maximum rate at which a new employer can be taxed was increased from 2.7 percent to 4.2 percent.

South Dakota increased the maximum contribution rate from 4.1 percent to 7.0 percent.

The amount needed to qualify for benefits was increased to 20 times (formerly 10) the weekly benefit amount outside the highest quarter, and the minimum amount of high-quarter wages required was increased to $600 (formerly $400). The State further restricted conditions under which partial benefits will be paid by changing the definition of partial unemployment to a week in which the claimants earned less than half (formerly 1-1/2 times) the weekly benefit amount and by deducting three-quarters (formerly one-half) of a claimant's part-time earnings from his or her weekly benefits.

The penalty for fraud was changed from a variable period of 1 to 52 weeks to either a misdemeanor or a felony under the State's criminal code.

School employees will be denied benefits during established, customary vacation or holiday periods.

Disqualification for the three major causes was changed from a variable period to the duration of the claimant's unemployment and until he or she has been reemployed in covered work for 6 weeks and has earned wages in each of those weeks equal to the weekly benefit.

The criteria for determining whether a voluntary quit was with good cause now include considerations of the claimant's health and the employer's conduct. Disability payments are no longer deductible.

Tennessee repealed the exclusion from the automatic denial of benefits to hourly paid nonprofessional school personnel between school terms.

Utah will reduce a claimant's weekly benefit by 100 percent (formerly 50 percent) of his or her weekly retirement benefits. The formula used to compute benefits for a week of partial unemployment was changed so that now the weekly benefit is reduced by the amount of earnings in excess of 30 percent of the benefits. Formerly, the amount disregarded was that in excess of 50 percent of the weekly benefit amount, or $12, whichever was less.

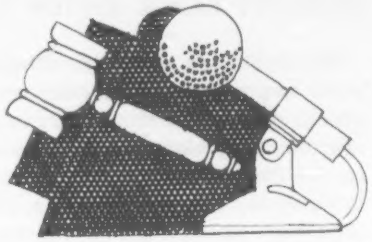
A claimant is required to make an active effort to secure work. Disqualifications for the three major causes were changed, so that now the claimant is ineligible for the duration of his or her unemployment and until he or she earns 6 times the weekly benefit amount in covered work.

Disqualification because of fraud continues for 13 weeks for the first week in which fraud is committed plus 6 weeks for each week of commitment thereafter, but not more than a total of 49 weeks of disqualification. In addition the claimant must pay back twice the amount fraudulently received. Formerly, disqualification continued for 52 weeks and until the fraudulently received benefits were repaid.

Virginia now denies benefits to part-time and substitute school employees. In addition, the State extended the between-terms denial during customary and established vacation periods. Quitting work to accompany or join a spouse in a new locality is no longer considered a good cause for leaving work. Also, an individual is disqualified while incarcerated.

West Virginia increased the percentage of the State's average weekly wage used to compute the maximum weekly benefit amount from two-thirds to 70 percent. A claimant is required to have earned wages in two calendar quarters to be eligible for benefits.

To be considered available for work, an individual must do what a reasonably prudent person in similar circumstances would do to seek work. Employees on vacation at the employer's request now are not considered unemployed and, thus, are ineligible for benefits. ☐



Conventions

Arbitration and the rights of mentally handicapped workers

BENJAMIN W. WOLKINSON AND DAVID BARTON

In the last few years, there has been a growing awareness of the vast extent and cost of mental illness at the work site. It has been estimated, for example, that emotional problems are responsible for approximately 20 to 30 percent of employee absenteeism, that one-fourth of any large work force is in serious need of help for psychological or social problems, and that at least 65 percent of all discharges result from personal factors rather than technical incompetence.[1]

The widespread and frequent occurrence of mental disability suggests that managers are often faced with sensitive decisions about how to accommodate both the needs of afflicted employees and the economic interests of the firm. The Rehabilitation Act of 1973 places new constraints on organizations that receive Federal funds, requiring them to accommodate physically or mentally handicapped employees.[2] Equally important but less well appreciated are the rights and protections afforded mentally disabled employees by the just-cause disciplinary provisions of collective bargaining agreements. As this report will demonstrate, the industrial common law that has evolved from grievance proceedings has established definite restraints on management's ability to penalize workers afflicted by mental illness. Furthermore, this industrial common law appears to impose on employers some duty to accomodate the specific needs of affected workers.

Protection of job rights

Between 1947 and 1978, there were 38 reported arbitration decisions involving the discharge or denial of reinstatement to employees with mental disabilities.[3] In only 10 of these cases was management's decision upheld. Apparently, arbitrators impose a stiff evidentiary burden on employers seeking to terminate a mentally handicapped worker. Only when a mental disability exposes the employee or others to serious risks of injury or harm or, alternatively, prevents the employee from performing his duties was the discharge upheld. In 7 of the 10 cases where termination was upheld, the arbitrator found that the employer had demonstrated through competent medical testimony that the grievant could not safely or successfully perform his or her job.[4]

In five of the approved terminations, there were additional findings that the worker's disability precluded the performance of any job in the bargaining unit.[5] One case involved an employee with 16 years of service; following brain surgery, he was no longer able to function efficiently, and the company reluctantly terminated him. The arbitrator concluded that the employer had acted properly: it had consulted the union, had given the employee additional time to recuperate, and had demonstrated that all other positions in the bargaining unit entailed the same level of skill and difficulty.[6] Several other cases concerned employees diagnosed as psychotic with histories of violent outbursts on the work floor, and who posed a danger to customers, fellow employees, and the employer's property.[7]

Although employers may terminate a worker on the basis of compelling evidence of disability, they cannot discipline an employee solely because of previous confinement or treatment for a diagnosed mental disability. In one case,[8] a firm was ordered to reinstate with back pay a worker hospitalized and successfully treated for mental illness. Similarly, a worker suspended pending a psychiatric examination was awarded full back pay. As a result, an employer's authority to suspend a worker pending the results of a mental examination may be limited to cases where there is some basis to conclude that the individual is suffering from a disability.[9]

Furthermore, an employee who has undergone mental treatment may not be denied reinstatement because of management's unverified or unsubstantiated fears of coworker or community disapproval. Thus, a successfully treated sexual psychopath was ordered reinstated in a case where management fears of community disapproval had not been verified.[10] Such fears were considered especially misplaced because the grievant's job did not require contact with anyone other than coworkers.

Benjamin W. Wolkinson is associate professor of industrial relations at the School of Labor and Industrial Relations, Michigan State University. David Barton is Director of Labor Relations, Hurley Medical Center, Flint, Michigan.

In some cases, the onset of mental illness may be acute and noticeable. In other cases, it may be evidenced only by subtle changes in behavior. Considerable time may elapse before a recognizable pattern of mental illness develops. Despite this inherent difficulty in discerning either the nature or commencement of an employee's illness, arbitrators have generally maintained that the firm is responsible to thoroughly investigate and consider a worker's emotional problem before imposing discipline. This requirement is particularly relevant when dealing with a long-term employee who has an otherwise satisfactory work record and whose behavior as a result of mental stress or breakdown is radically or suddenly altered.

One firm discharged an employee who assaulted a supervisor during an argument over an open plant window. The discharge was voided, however, because management had failed to discover that the worker was under medical treatment for hypersensitivity and that prior to the incident had spent the previous night searching for his missing son.[11]

At the same time, employees confronted by management for explanation of rule infractions may be obliged to communicate the nature of their emotional problems or mental disability where it has influenced the questioned conduct. The dismissal of a mentally depressed employee for excessive absenteeism was upheld in one case, because of the employee's repeated refusal to reveal to management the reasons for his absence, which included treatment and hospitalization for his illness.[12] Without knowledge of mitigating factors, the arbitrator ruled, the employer had no alternative but to exercise its normal disciplinary policy.

Under mental stress, some employees have suddenly departed from the job, informing management that they were quitting. When they subsequently sought reinstatement, their requests have often been denied on the grounds that, by voluntarily quitting, they had terminated their seniority rights and employee status. Although recognizing that ordinarily employees lose seniority and job rights by quitting, arbitrators have made exceptions if, when "quitting," the employee lacked the necessary mental capacity to make a meaningful decision. For example, one arbitrator ruled that management had acted "precipitiously and prematurely" in terminating as a voluntary quit an employee who during a screaming rage assaulted a supervisor and abruptly quit after being denied a leave of absence.[13] Because the employee's action was not the result of a considered judgment but rather an emotional outburst of a sick man, the arbitrator found that management should have placed the grievant on sick leave.

Seniority rights are also typically broken when an employee has been absent without prior notice. Although dismissal for such conduct may be sanctioned by past practice or authorized by agreement, arbitrators have been reluctant to apply such standards to the mentally disabled. Dismissals of mentally handicapped workers for violating such reporting provisions have usually been overturned on the grounds that their application is unfair and unreasonable.[14]

A duty to accommodate

The Rehabilitation Act of 1973 requires organizations that receive Federal funds to accommodate handicapped persons; has a parallel responsibility been generated by just-cause provisions of collective agreements? The nature of management's required accommodation has generally focused on two important questions: (1) when a mentally disabled worker can no longer perform his job, is management required to seek out and transfer the employee to other jobs for which he or she can qualify? and (2) where the evidence indicates that the mentally ill employee cannot perform any job in the bargaining unit, is management obliged to place the worker on leave until he or she undergoes successful treatment permitting reinstatement?

In many cases, the mentally disabled employee is unable to perform any job, so that transfer is not an alternative. This may occur with a psychotic employee predisposed to violent outbursts. At other times, however, the stress of a particular job may precipitate a breakdown, and transfer to a different job may enable the employee to return to employment. Whether employers are obliged to accommodate a mentally ill employee through job transfers is the subject of conflict among arbitrators.

The strongest statement of management's duty to accommodate appears in the following excerpt from a 1972 case:[15]

> Arbitrators are reluctant to uphold a discharge for such [emotional] disability unless the employer can show that not only can the disabled employee no longer perform his own job adequately, but that there is no other job available that he can do. There is a degree of callousness involved in turning out a senior employee because of disabilities (physical or emotional) if he is capable of doing a less demanding job satisfactorily.

The worker was ordered reinstated to a less demanding job that he had previously performed without difficulty.

Other arbitrators have also indicated that employers must do everything possible to enable the mentally handicapped employee to adjust to normal work life, including transfer to other jobs.[16] Supportive of this approach is a case in which a discharge of an emotionally unstable employee who handled explosives was voided. Instead, the grievant was placed on suspension pending a joint management-union review to determine whether there were other jobs that the grievant could safely handle.[17] Similarly, in a 1964 case, a worker was ordered reinstated to an available job which was least likely to produce stress or irritation.[18] Although these cases involved workers' reinstatement because of management's failure to accommodate, it is also significant that in 5 of the 10 cases where a worker's dismissal was upheld, the arbitrator determined that the grievant was unable to perform any job in the facility.[19]

A small minority of arbitrators have been reluctant to impose upon management the duty to consider a mentally disabled employee for other less stressful jobs once evidence indicates an inability to perform the most recent job. For example, in a 1948 case, an arbitration board ruled that in the absence of any express or implied provision in the agreement entitling employees to transfer, management had full discretion to fill vacancies and maintain its policy of no interdepartmental transfers.[20] As a result, an employee suffering from a serious disorder was barred from obtaining a position his psychiatrist felt he could satisfactorily perform; he was terminated for unsatisfactory performance in his current position.

More recently, an arbitrator upheld the contention that management is not obliged nor is an arbitrator empowered to move a mentally handicapped employee to other jobs. It was suggested in that case that such an approach would be tantamount to the creation of a disability retrogression clause in agreements.[21] Significantly, however, this strict constructionist approach has been taken by only a small number of arbitrators.

Just as arbitrators have been divided over the transfer rights of a mentally disabled employee to a less strenuous job, they have also split over a firm's obligation to place a mentally ill worker on leave until recovery. In some cases, dismissals have been upheld on evidence that the worker is presently incapacitated and there is reason to believe that additional treatment would not be very helpful.[22] For example, in one case, the grievant had a history of mental illness and treatment, including hospitalization and drug therapy. Nevertheless his condition deteriorated, and based on the likelihood of worsening symptoms, the discharge was upheld.[23]

Some arbitrators, however, have ignored the issue of future employability, upholding a dismissal solely on the basis of the worker's present mental condition.[24] Thus, no concern may be given to the possibility that the individual might be rehabilitated through professional treatment. Although hoping that a grievant would obtain medical treatment, one arbitrator refused to require management to give the employee the opportunity to become rehabilitated before finalizing a dismissal.[25]

Other arbitrators, however, have been inclined to order reinstatement if prior to the hearing the grievant had successfully undergone treatment and was reemployable. In cases where the grievant's illness was found to be in a state of remission,[26] reinstatement has been conditioned on continued receipt of medical treatment[27] or satisfactory completion of a trial period.[28]

Significantly, an increasing number of arbitrators have ruled that a mentally ill employee's inability to perform his or her job or other jobs in the facility does not constitute just cause for dismissal. The imposition of the discharge penalty has been viewed as signifying egregious fault on the part of the worker, and the element of fault has been considered inopposite when dealing with individuals who have no control over their actions.[29] Furthermore, there has been a growing sentiment to treat mental illness like any other physical illness or disability. This approach would give the mentally ill employee the opportunity to seek treatment and to be reemployed upon recovery. An arbitrator in a 1977 case strongly affirmed this view by placing on sick leave a psychotic employee dismissed for an unprovoked assault upon a coworker:[30]

> . . . [A] person's mind is no less a part of his body than any other portion of his anatomy. Simply stated, a person who cannot be kept on the active payroll because his mind is abnormal is, in fact, disabled from work and sick just as a person who is unable to work due to a broken arm, unduly high blood pressure, or any other physical ailment, is sick and disabled from work. Thus, there is no reasonable basis for distinguishing between a disability due to a physical illness and one due to a mental disorder.

Following this approach, many arbitrators have voided the discharge of employees proved to be mentally incompetent to perform any job. Instead, they have allowed management only to temporarily remove the employee from the work site, with reinstatement rights upon reasonable assurance from medical authorities that the employee no longer constitutes a risk to himself or others.[31] Typically, the employee has been placed on sick leave[32] or, alternatively, on a medical leave of absence without pay.[33] Additionally, a dismissal may be overturned if the amount of leave extended is viewed as unreasonably deficient. Following a 3-month leave to undergo psychiatric treatment, a worker was discharged for dangerous horseplay conduct. The discharge was overturned, however, because the amount of leave was less than afforded other employees.[34]

In requiring employers to accommodate the mentally ill employee, arbitrators have been keenly aware of the tragic impact that dismissal may have on a worker's future employment opportunity.[35] Once stigmatized as mentally incompetent, such employees may face permanent exclusion in the job market even after successful treatment. Consequently, although recognizing management's right to protect plant safety and efficiency, many arbitrators have found that the proper balance between such interests and employee job rights is better struck through the mechanism of temporary removal rather than outright dismissal.

Appropriate medical evidence

A central issue in grievances involving the mentally ill is the employee's capacity to perform. Here arbitrators have typically relied on the expert opinion of qualified medical authorities. Thus, when medical experts testified that the grievant was seriously ill and the prognosis for future rehabilitation was minimal, the dismissal was almost always upheld.[36] Conversely, when medical evidence indicated that the grievant's condition had improved and permitted satisfactory job performance, the dismissal was normally overturned.[37] With insufficient medical evidence upon which to evaluate the grievant's employability, arbitrators have directed the parties to jointly select a competent psychiatrist to examine the grievant and provide an opinion. For example, one arbitrator required an employer to allow a worker to be reexamined before deciding the reinstatement issue, because it had been a year since the grievant's last psychiatric examination.[38]

At times, arbitrators have been confronted with conflicting medical opinions. As illustrated in the following excerpt from a 1961 case,[39] such conflict occurs more frequently in mental disability cases as opposed to physical handicap cases.

> The resolution of such cases where actual physical disability is involved is a clear-cut fact situation which is easily subject to expert medical testimony and experiences resultant from long years of medical knowledge of the various disabilities. In the field of mental disability, a more nebulous and complex area of medical knowledge and experience is involved. Two equally expert medical men can easily arrive at opposite conclusions on any given case because of lack of concrete medical knowledge concerning mental illness and the subjective nature of such illness.

Presented with conflicting medical reports, arbitrators have used common sense notions in determining the weight given particular testimony. For example, when faced with conflicting medical evidence based on examination of the grievant undertaken at two different times, one arbitrator gave more consideration to the more recent opinion.[40] Similarly, another arbitrator relied more on a medical opinion based on a series of interviews with, and psychological testing of, the worker as opposed to a different judgment formed by one doctor after a single meeting with the grievant.[41] Alternatively, an arbitrator has given more weight to a medical opinion corroborated by a second doctor rather than the opinion of a single physician.[42] At times, a conflict in medical testimony has been settled in favor of the grievant because an adverse decision would result in dismissal.[43]

Arbitrators usually have not attempted to determine whether one doctor is more qualified than another. In a 1972 case, the employer argued that its physician's opinion should be given more weight because he was a diplomat of the American Board of Psychiatrists and the union's doctor was not. However, the arbitrator reasoned that because the union's physician practiced psychiatry he had all the legal and professional credentials necessary.[44] In another case, a medical opinion based on the individual's full file (work history, medical records) combined with other physicians' examinations was given more consideration than the opinion of the doctor who did not have this additional information.[45] Similarly, the company doctor's opinion was held to outweigh that of an outside psychiatrist who had based much of his opinion on a falsified work history supplied by the grievant.[46] Finally, when the medical evidence appears evenly divided, the arbitrator may resolve the dilemma by reinstating the grievant for a trial period. This solution was used where the company doctor had recommended dismissal because of his concern that remission of the grievant's medical disorder was not likely to last, but the employee's psychiatrist had favored reinstatement because of the worker's present satisfactory condition and the possibility that the remission would continue.[47]

Available remedies

In 11 cases where employees were suspended, dismissed, or denied reinstatement, back pay and reinstatement were ordered. Outright unconditional reinstatement with back pay was usually ordered when management failed to demonstrate that the grievant posed a danger to safety or operating efficiency.[48]

When the grievant had been guilty of some impropriety, an employer's back pay liability was often reduced. For example, in a 1964 case, a worker was discharged for carrying weapons onto his employer's property. Finding the employee's conduct to be caused by mental illness for which he was successfully treated, the arbitrator ordered the worker reinstated. However, because of the misconduct, back pay was ordered only from the date of the hearing.[49] When no credible evidence supported a suspension, the employer's back pay liability has run from the date of discharge to date of reinstatement.[50] Employees who have been successfully treated and subsequently denied reinstatement have received back pay from the date of the employee's request for reinstatement,[51] or the company's receipt of a psychiatric report indicating the worker's reemployability.[52]

Conditional reinstatement with back pay was ordered in four cases. This remedy was implemented when the individual still required treatment and there was some doubt concerning his employability. With a conditional reinstatement, special restrictions or requirements have been imposed on the worker. In a pair of cases more than 20 years apart, a worker was placed on a 6-month trial period, during which management was permitted to discharge the individual if unable to perform.[53] In another pair of cases, reinstatement was conditioned on the worker receiving medication and seeing a psychiatrist periodically.[54]

Conditional reinstatement reflects the efforts of arbitrators to accommodate both the job rights of the employees and the legitimate business interests of the firms. It suggests that although companies would prefer to receive absolute assurances that the grievant can be reemployed without problems, such assurances are difficult to communicate and rarely provided. Moreover, the absence of such iron-clad assurances is not an appropriate basis for the denial of reinstatement if competent medical authorities are reasonably assured that with continued treatment the grievant is employable. Employer doubts are not dismissed, but are considered and acted upon by conditioning reinstatement on the completion of a probationary period or the grievant's continued treatment, or both. At times, back pay has been denied because the discharge was considered reasonable at the time the decision was made or because the employer had acted in good faith and upon the advice and recommendation of company doctors.[55]

A final remedial approach has been used in cases where the grievant was presently unemployable. As discussed earlier, a significant number of arbitrators have viewed discharge as inappropriate, reasoning instead that the grievant be placed on some type of leave (sick leave if the worker is entitled or, alternatively, leave without pay) until recovery. For example, in one case, an employee with a 22-year record of satisfactory performance developed a serious manic depressive condition with no clear prognosis for recovery. The grievant was ordered placed on sick leave until recovery or until he reached retirement age.[56] Similarly, a psychotic individual was ordered placed on leave with a right to reinstatement upon evidence that he could be reemployed without risk to himself or others.[57] These cases appear to reflect the view that mentally disabled employees may be rehabilitated with proper care; and even though it may not be the firm's responsibility to provide for or fund treatment, the individual should have the opportunity to obtain it without suffering permanent job loss. When an arbitrator has voided the discharge of an individual judged unemployable, however, back pay has not been awarded.[58] Back pay has been an issue only when an employable person has been denied the opportunity to work.

Mitigating factors

In 10 of 27 dismissal cases where the grievance was upheld, the employee's previous satisfactory performance operated as a mitigating factor.[59] For many arbitrators, evidence of meritorious past performance may suggest the individual's capacity to function effectively following successful treatment. Consequently, upon recovery, such an individual has been reinstated. The following excerpt from a 1964 case illustrates this perspective:[60]

> . . . [T]his service record (9 years without discipline) clearly entitles the grievant to an opportunity to show that he can continue to serve the company in the same acceptable fashion as in the past . . . this long favorable past record obligates the company to afford such an opportunity to the grievant.

The discharge of an employee with a long record of satisfactory service has been nullified when management failed to investigate the circumstances surrounding the individual's sudden incapacity to function.[61] Moreover, accommodation to the needs of mentally ill employees has often been required when the employee has had many years of meritorious service. In a pair of cases,[62] the employers were ordered to find alternative jobs for mentally handicapped employees with many years of seniority.

At the same time, past performance alone has not necessarily immunized the mentally ill employee from dismissal. The dismissals of long-term employees have been upheld where the individual was unable to perform any job and the prognosis for recovery was poor.[63] A few arbitrators have upheld the dismissal of a long-term employee solely on the basis of present unemployability, without considering whether future treatment may be beneficial. Thus, one arbitrator upheld a worker's dismissal, although noting that it was entirely probable that the grievant's mental disability was temporary.[64]

Another consideration that has influenced arbitrators' decisions is an employer's past practice. Where past practice suggested that mentally ill individuals have been afforded time off to obtain medical treatment, the sudden dismissal of a mentally ill worker regardless of his present unemployability has usually been overturned.[65] The case against dismissal under such circumstances has also been strengthened by evidence that others hospitalized for mental illness were reinstated successfully.[66]

Past practice, however, has also been used to justify an employer's refusal to accommodate. In a 1948 case, an employee being treated for mental illness had sought transfer to a job his doctor had felt he could better handle. Management's rejection of the transfer request was upheld because the contract implied that the company could determine how vacancies would be filled, and past practice showed no deviation from the employer's established policy of barring inter-departmental transfers.[67]

Yet a rigid policy of no accommodation has been overtuned, notwithstanding past practice. Despite an alleged policy of never reemploying individuals who have been confined for mental illness, a firm was ordered to reinstate an employee who had been successfully treated and was able to resume work.[68] Thus, the policy of no reinstatement under any circumstances was considered unreasonable and modified.

Emerging equity through arbitration

Mentally disabled employees pose unique and difficult problems for those in the employment relationship. Employers must consider plant efficiency and safety, unions must protect the job security of their membership, and all parties face the difficulty of the uncertain and unpredictable nature of mental illness, which makes diagnosis and prognosis problematic.

There is an apparent trend among arbitrators to view discipline as an inappropriate mechanism by which to compel the mentally ill employee to adhere to work rules and production norms. Discipline is normally meted out to those who should have been aware and nevertheless ignored, or who knowingly violated, reasonable plant rules and policies. Given this framework, the discipline of an employee whose mental illness deprived him of the capacity to satisfy appropriate standards of conduct is improper. As a result, the dismissal of mentally ill employees for infractions such as excessive or unreported absences, insubordination, or assault has been increasingly viewed as a breach of contractual just-cause provisions.

Although arbitrators have split over management's duty to accommodate, a growing number have required firms to examine whether the employee could perform other jobs in the bargaining unit. Even when there has been no other job available, there was a reluctance to uphold dismissal when there was some hope that through treatment the mentally ill employee could become reemployable.

The expanded reach that many arbitrators have given to the just-cause provisions of contracts parallels the protections of the Rehabilitation Act of 1973, requiring employers to make a "reasonable accommodation" to handicapped applicants and employees. This congruency between Federal law and industrial jurisprudence should facilitate the informal settlement of grievances of the handicapped, an outcome favored by U.S. Department of Labor regulations enforcing the statute.[69] Under regulations implementing Section 503 of the law, a complainant who works for a Federal contractor must first attempt to resolve the issue through the employer's grievance procedure when one is available. Only when no agreement satisfactory to the grievant has been reached after 60 days may the Office of Federal Contract Compliance Programs begin an investigation.

The settlement of employment disputes involving mental disability through grievance adjustments and arbitration provides the employee with a more expeditious avenue of relief than would otherwise be available through resort to the Government's compliance process under the 1973 statute. The remedies available under Sections 503 and 504 include the withholding of progress payments, termination of Federal contracts, and debarment from the receipt of future contracts. Although these are powerful remedies, experience with similar enforcement measures for antibias requirements suggests that the likelihood of their implementation to enforce rights of the handicapped is minimal.[70] Furthermore, although injunctive relief is available under Section 503,[71] to date it has not been sought in any case. Consequently, arbitration remains an important tool to protect the employment opportunities of mentally disabled employees.

Recently, there have been significant questions raised concerning the relevance of arbitration in areas which are becoming increasingly subject to Federal regulation.[72] A review of arbitration decisions involving the mentally handicapped shows that, although overlap may exist between external law and contractual adjudication, arbitration serves as an important mechanism for preserving workers' rights. In an era of ever-increasing administrative backlogs and clogged court dockets, reliance on informal methods of dispute resolution is a healthy phenomenon that should be encouraged. ☐

Special Labor Force Reports–Summaries

Marital and family characteristics of the labor force, March 1979

BEVERLY L. JOHNSON

The rising number of multi-earner families has been one of the most important socioeconomic developments of the 1970's. In March 1979, a record 3 out of every 5 married-couple families reported having had at least two members who were earners during the previous year. Since 1970, the number of such families has increased by more than 3 million, reaching 28.4 million.[1] (See table 1.)

Almost exclusively responsible for the rising number of multi-earner families have been the steep annual increases in the number and proportion of working wives. (See table 2.) Year after year, married women have continued to record spectacular gains in labor force participation. Since March 1970, the number of wives in the work force has increased by one-third, rising from 18.4 million to nearly 24 million. More than half of this gain (54 percent) was among wives 25 to 34 years old.

The labor force participation rate of married women had risen to 49.4 percent by March 1979, an increase of nearly 9 percentage points since 1970. (See table 3.) In contrast, the participation rate of husbands has been in a long-term decline. At 81.4 percent in March 1979, the rate for husbands had dropped by more than 5 percentage points since 1970—a reduction greater than that recorded during the preceding 2 decades.

Continuing its upward trend, the rate for white wives rose significantly over the year ending in March 1979, reaching 48.5 percent. The participation rates for black (59.7 percent) and Hispanic wives (46.3 percent) registered no significant change from a year earlier but have also risen considerably since the mid-1970's. Reflecting the higher labor force participation rate of black wives, the proportion of black families with 2 earners or more during 1978 was higher than that for white or Hispanic; 64.5 percent of black married-couple families, compared with 59 percent of white and Hispanic families, had more than one earner.

There was little year-to-year change in the labor force participation of husbands whether white, black, or Hispanic. However, both the rates for white and black husbands have drifted down over the decade, to 81.5 and 80.0 percent. The rate for Hispanic husbands (87.4 percent) was at the same level in early 1979 as at mid-decade (when separate data for this ethnic group first became available).

Family income

Working wives made substantial contributions to their families' economic welfare. In 1978, they contributed about 26 percent to family income, a proportion that varied considerably by the extent of their work experience. When wives worked 50 to 52 weeks full time they contributed an average of 40 percent to family income; when they worked full time 27 to 49 weeks, they contributed about 30 percent; and when they worked up to a half year full time or 1 to 52 weeks part time, their share was approximately 11 percent. These proportions have remained relatively unchanged throughout the 1970's. One factor accounting for this is that there has been very little change in the occupational distribution of wives; that is, they have not yet gained full access to many of the high skill, high paying jobs. It is largely because of this that the basic ratio of women's to men's earnings has not changed much for years.[2]

The impact of wives' earnings on family income is clearly shown by the income differences between one-earner and multiple-earner families. In 1978, median family income for white multi-earner families was $23,300, 37 percent higher than families with one earner. For black families with two earners or more, median family income was $19,500, 66 percent higher than that of families with only one earner. Hispanic multi-earner families had an average annual income of $17,900, 59 percent higher than that of families with only one earner. Because of this, married-couple families with multiple earners have an exceedingly low incidence of poverty.[3] For white families with more than one earner, fewer than 2 percent were living below the poverty level, compared with 6 percent of the families with only one earner and 16 percent of those families with no earners. For black and Hispanic multi-earner families, only about 5.5 percent were living below the poverty level. However, as among the white population, the

poverty rate among these minority groups was 4 times higher for families with only one earner and 8 to 9 times higher for those married-couple families with no earners in the home.

Married-couple families with children under 18 were far more likely to have two earners or more than were those families with no children—63 percent, compared with 51 percent in March 1978.[4] This reflects both greater economic pressures of families raising school- and preschool-age children, as well as the comparatively higher concentration of older, often retired, husbands and wives among families with no children. About 51 percent of wives with no children under 18 were age 55 and older, compared with only 2 percent of the married mothers with children under 18.

Working mothers. The labor force commitment of all mothers showed unusual strength in the 1970's and by March 1979, 16.6 million, or 54 percent, of the women with children under 18 were working or looking for work. (This compares with 12 million or 42 percent in 1970, and 8 million or 30 percent in 1960.) Most working mothers were married but nearly 1 of 4 (23 percent) was divorced, separated, widowed, or had never been married. Partly reflecting the sharp decline in birth rates[5] during the 1970's, and consequently fewer children for families to care for, the labor force participation rate of married mothers zoomed upward—from 39.7 percent in March 1970 to 51.8 percent. (See table 4.) Divorced mothers remained far more likely than other mothers to be working or looking for work—79 percent did so in March 1979.[6]

The tremendous influx of mothers into the 1970's work force occurred both among those with school-age as well as those with preschool-age children; in March 1979, 62 percent of mothers with children 6 to 17 years old and 45 percent of those with children under age 6 were working or looking for work. Comparable rates for 1970 were 52 and 32 percent.

Black mothers are still more likely than white or Hispanic mothers to be in the labor force. However, the sharpest increase in participation during the late 1970's has been registered by white mothers. As a result, the difference in labor force participation between black and white mothers has narrowed considerably. From March 1975 to 1979, the rate for white mothers rose from 46.0

to 53.5 percent; for black mothers, it went from 56.0 to 61.3 percent; and for Hispanic mothers, the rate increased from 39.5 to 44.8 percent.

Children of working women. In March 1979, the number of children under 18 whose mother was in the labor force was 30.1 million, a gain of 4.6 million from 1970. (See table 5.) A smaller proportion of white (49 percent) than of black children (61 percent) in two-parent families had working mothers. However, when there were no fathers in the home, white children were more likely than black to have mothers in the labor force—67 and 53 percent, respectively. Among Hispanic children, 43 percent of those in two-parent families had

working mothers, compared with 39 percent of those in families maintained by the mother.

One-parent families

Among the most striking changes that occurred during the 1970's was the sharp rise in the number of working women who had the principal responsibility for the maintenance and welfare of their own families. About 1 of every 9 women in the March 1979 labor force (5 million) maintained her own family and was divorced, separated, widowed, or had never been married. Mainly because of the rising incidence of marital breakup,[7] the number of families maintained by women increased substantially over the decade, so that in March 1979 these families totaled 8.5 million, or 1 of every 7 families.

Children under 18 were present in about 5.3 million families maintained by women. (See table 6.) In fact, most of the over-the-decade gain in the number of families maintained by women occurred among families with children. From March 1970 to 1979, the number of single-parent families maintained by women rose by 80 percent, while those maintained by men increased by more than 70 percent.[8]

One-parent families are largely those of female householders and face economic difficulties rarely encountered by families with male householders. In 1978, 42 of every 100 single-parent families maintained by the mother had incomes below the poverty level, compared with 15 of every 100 maintained by the father and 6 of every 100 two-parent families.[9]

Accompanying the large increases in the numbers of mothers maintaining their own families have been unprecedented gains in the number who are working. In March 1979, 65.9 percent of mothers maintaining their own families were in the labor force, compared with 59.4 percent in 1970. As might be expected, the labor force participation rates of mothers in one-parent families varied by the age of the youngest child, with those having school-age children being far more likely than those with their youngest child under 6 years to be in the labor force—72 percent, compared with 56 percent. Women who are divorced, separated, or widowed often experience substantial declines in their family income. In 1978, the median income of families maintained by the mother was only 34 percent that of two-parent families. However, when the single parent was a father, the rate jumped to 71 percent.

Several factors contributed to these income differences. First, families maintained by the mother are far more likely to have no earners in the home than are other families. Approximately 28 percent of families maintained by mothers, compared with 9 percent of those maintained by fathers and only 1.6 percent of two-parent families, had no earners in the home. Second, single-parent families maintained by the mother were less apt to have 2 earners or more—only 19 percent had 2 earners or more, compared with 28 percent of one-parent families maintained by the father and 64 percent of two-parent families. Furthermore, a very high

proportion of mothers in single-parent families had not completed high school—4 out of 10 in March 1979—and low educational levels are usually associated with low labor force participation, high unemployment, and low pay.

Even when the mother was in the labor force, family income was likely to be considerably lower than that of either two-parent families with working mothers or single-parent families maintained by working fathers. Average income in 1978 of single-parent families with working mothers ($8,900) was only 40 percent that of two-parent families with working mothers ($22,200) and 54 percent that of one-parent families maintained by working fathers. ☐

FOOTNOTES

[1] This report is the latest from an annual series based primarily on information from supplementary questions in the March Current Population Survey. The most recent report on this subject, containing data for March 1978, was published in the *Monthly Labor Review*, April 1979, and reprinted as Special Labor Force Report No. 219.

The data in this report relate to the noninstitutional population 16 years and over, including those male members of the Armed Forces living off post or with their families on post (824,000 in March 1979). Sampling variability may be relatively large in cases where numbers are small, and small differences between estimates or percentages should be interpreted with caution.

[3] Families are classified as being above or below the low income level according to the poverty index adopted by a Federal interagency committee in 1969. The poverty thresholds are updated every year to reflect changes in the Consumer Price Index. Thus, the poverty threshold for a nonfarm family of four was $6,662 in 1978, 7.6 percent higher than the comparable 1977 cutoff of $6,191. For further details, see *Characteristics of the Population below the Poverty Level: 1977*, Current Population Reports, Consumer Income, Series P-60, No. 119 (Bureau of the Census) 1979, p. 206.

[4] Latest data available from special computer run for March 1978.

[5] The birth rate declined from 18.4 per thousand population in 1970 to 15.3 per thousand in 1978. See *Monthly Vital Statistics Reports*, Vol. 27, No. 13, August 13, 1979 and Vol. 23, No. 13, May 30, 1975, U.S. Department of Health, Education, and Welfare, Public Health Service.

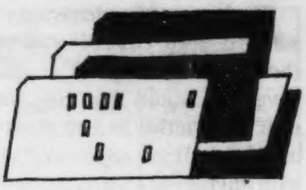
Research Summaries



Workers' expectations about losing and replacing their jobs

CHARLES N. WEAVER

How secure do workers feel about keeping their jobs? How confident are they that they could find another job?

Two recent nationwide surveys indicate a high degree of confidence on both counts, despite relatively high unemployment. In 1977 and in 1978, only a few of the workers surveyed feared the loss of their jobs, and a majority thought they could find comparable work without much difficulty. (In 1977, the national unemployment rate was 7 percent and in 1978, 6 percent.)

The results indicate considerable variations, however, among various categories of full-time workers. Certain workers, including blacks, those with less education, lower earnings, and lower skilled jobs, tended to experience greater insecurity of employment. They were more likely to fear the loss of their jobs or of being laid off within the next 12 months and were more likely to anticipate difficulty in finding a comparable job. Similarly, workers with more education, higher earnings, and higher skilled jobs typically experienced a greater sense of security in their present jobs and were more likely to believe that finding a comparable job would be easy.

The data were taken from the 1977 and 1978 General Social Surveys conducted by the National Opinion Research Center at the University of Chicago, with funds from the National Science Foundation.[1] Expectations about losing one's job and about finding another job were measured by responses to the following questions:

> **Thinking about the next 12 months, how likely do you think it is that you will lose your job or be laid off—very likely, fairly likely, not too likely, or not at all likely?**
>
> **About how easy would it be for you to find a job with another employer with approximately the same income and fringe benefits you have now? Would you say very easy, somewhat easy, or not easy at all?**

When both sets of expectations are considered, several important dimensions of worker attitudes toward job security become apparent (table 1). For instance, blacks were not only almost twice as likely as whites to expect to lose their jobs or be laid off within the next 12 months, but were also significantly less likely than whites to believe that finding another job would be easy. Additionally, older workers were less likely to expect that they would lose their jobs or be laid off within the next 12 months (probably due to seniority), but they were more likely to believe that it would be difficult to find a job with similar earnings and fringe benefits.

Table 1. Workers who expect to lose their jobs and those who think they could find another job without much trouble

[In percent]

Characteristics	Expect to lose job	Could find another job
Overall	7.7	59.2
Sex:		
Male	7.7	60.5
Female	7.7	57.6
Race:		
White	7.0	60.2
Black	13.2	50.3
Age:		
18-29	11.1	67.9
30-39	8.5	62.3
40-49	5.2	59.5
50-59	4.5	46.7
60 and over	3.4	24.4
Education:		
Grade school	9.0	48.8
High school	8.8	56.9
Some college	9.0	68.4
College degree	2.7	62.2
Graduate work	1.3	72.3
White-collar workers:		
Professional-technical	3.2	67.4
Administrative-managerial	5.4	65.4
Salesworkers	3.6	58.9
Clerical workers	8.0	61.4
Blue-collar workers:		
Craftworkers	9.3	63.1
Operatives	13.7	45.8
Laborers	15.1	41.1
Service workers	8.2	54.0
Personal income:		
Less than $5,000	12.7	65.1
$5,000-$6,999	8.1	59.9
$7,000-$9,999	9.5	57.2
$10,000-$14,999	7.4	55.2
$15,000-$19,999	6.8	55.6
$20,000 and over	1.0	63.8

· Charles N. Weaver is a professor at the School of Business and Administration, St. Mary's University, San Antonio, Texas.

Workers with elementary school, high school, or some college education were much more likely than those with a college or graduate school education to believe they would lose their jobs or be laid off within the next 12 months, and workers with an elementary school or high school education were less likely than those with higher education to believe that it would be easy to find a similar job.

In contrast to blue-collar workers, white-collar workers were only half as likely to believe they would lose their jobs or be laid off within the next 12 months, and were significantly more likely to believe that finding another job would be easy. However, expectations of losing and finding employment varied considerably within the white- and blue-collar occupational categories. Professional-technical and administrative-managerial workers had the lowest expectations about losing their jobs or being laid off, and had the most confidence about finding another job. On the other hand, salesworkers also had low expectations about losing their jobs or being laid off but were least confident (among white-collar workers) about finding another job. And, compared with other white-collar workers, clerical workers had the highest expectations about losing their jobs or being laid off but had moderately high expectations about the ease of finding another job. Among blue-collar workers, operatives and laborers felt most insecure about their jobs, and were most skeptical about finding a similar job. Service workers were the least concerned about blue-collar workers losing their jobs but did not believe that finding a similar job would be easy. Craftworkers had moderately high expectations about losing their jobs, but had the highest expectations (among blue-collar workers) that finding another job would be easy.

Workers whose annual salaries were less than $5,000 had the highest expectations that they would lose their jobs or be laid off within the next 12 months, but they also had the highest expectations that it would be easy to find a similar job with another employer. Workers in the highest salary category, over $20,000, had the lowest expectations that they would lose their jobs or be laid off and had highest expectations that it would be easy to find a similar job. Workers whose salaries ranged in categories between $5,000 and $20,000 had approximately the same expectations about both losing their jobs and about finding similar jobs with other employers.

Knowing the characteristics of workers who expect to lose their jobs and of those who believe that they could easily find other jobs should be important for the following reasons. Because job security and job satisfaction are correlated,[2] those interested in improving morale should benefit from having knowledge of the conditions under which worker expectations about losing their jobs are most intense. And, because unemployment is correlated with jobseeker discouragement,[3] those interested in increasing employment should benefit from having knowledge of the conditions associated with fluctuations in worker expectations about finding another job. Furthermore, having knowledge of the conditions associated with *both* of these sets of expectations for the *same* workers should increase understanding of the attitudes of workers toward their overall employment security. □

FOOTNOTES

[1] Only persons age 18 and older who reported in the face-to-face interviews that they were employed full-time (35 hours or more per week) were included in this study, and the two groups were pooled into a single sample of 1,463 for analysis.

Hours and earnings of production or nonsupervisory workers, 1968–78

HOWARD DAVIS

Average hourly earnings of production or nonsupervisory employees on private, nonagricultural payrolls increased between 1968 and 1978 at an annual rate of 7.2 percent.[1] Average weekly hours dropped by 2 hours, from 37.8 to 35.8.

All industry divisions exhibited hourly declines except mining, as shown in table 1. Rising from a low of 41.9 hours in 1974 and 1975, mining reached a decade-high of 43.4 hours in 1977 and remained the same in 1978 under the stimulus of strong gains in coal mining and oil and gas extraction. The largest 11-year drops occurred in retail trade (−3.7 hours), services (−1.9 hours), and wholesale trade (−1.3 hours). Average weekly hours did not increase in any of these three industries after 1969. This was also true for hours in the finance, insurance, and real estate industry, although the total decline was only 0.6 of an hour.

A general cyclical pattern appears in mining, manufacturing, construction, and transportation and public utilities. Decreases in the number of hours in these industries occurred after the peak of economic expansion and either stopped descending or increased within the year following the recession low.[2]

The persisting decline of hours in trade and services

Howard Davis is an economist in the Office of Employment Structure and Trends, Bureau of Labor Statistics.

is related to the marked increase in part-time employment in these sectors. The average workweek for the private sector would have been 37.4 in 1978, rather than 35.8 hours, if the number of hours in each industry division in 1968 had been the same in 1978. The general decline within the various divisions would have reduced the average workweek by only 0.4 of an hour as a result of changes in compositional employment. The drop in hours paid for in the retail trade and service divisions amounted to 83 percent of the remaining decrease of 1.6 hours. Thus, much of the apparent long-term decline in weekly hours in the private sector is due to the pronounced shift of employment toward these rapidly expanding divisions.

As in the case of hours, divergences exist in the tempo of average hourly earning increases among industry divisions over the 11-year period. And for any given year, there is considerable variance among the year-to-year changes. While the overall pace of increase in average hourly earnings was 7.2 percent per year, the annual rate of change for individual industry divisions ranged from a high of 8.6 percent for mining to a low of 6.0 percent for the finance, insurance, and real estate industry. As shown in table 2, average hourly earnings in mining rose from 118 percent of the overall average for 1968 to nearly 135 percent in 1978, while earnings in retail trade dipped from 76 to 74 percent of the overall average. Nevertheless, the rankings among the industry divisions evidenced considerable stability over the 11-year period.

Earnings in mining exhibited the largest relative improvement, while those in finance, insurance, and real estate posted the largest slippage. In retail trade, earnings eased off slightly, remaining the lowest among the industry divisions. Average hourly earnings in the transportation and public utility industry also increased significantly, rising from 120 percent to almost 133 percent of the overall average.

Table 1. Average weekly hours and average hourly earnings of production or nonsupervisory workers on private nonagricultural payrolls, 1968 and 1978

Industry division	Average hourly earnings		Annual rate of growth	Hours		Change in hours
	1968	1978	1968–78	1968	1978	1968–78
Total	$2.85	$5.69	7.2	37.8	35.8	-2.0
Mining	3.35	7.67	8.6	42.6	43.4	+.8
Construction	4.41	8.65	7.0	37.3	36.9	-.4
Durable goods, manufacturing	3.19	6.58	7.5	41.4	41.1	-.3
Nondurable goods, manufacturing	2.74	5.53	7.3	39.8	39.4	-.4
Transportation and public utilities	3.42	7.55	8.2	40.6	40.0	-.6
Wholesale trade	3.05	5.88	6.8	40.1	38.8	-1.3
Retail trade	21.6	4.19	6.9	34.7	31.0	-3.7
Finance, insurance, and real estate	2.75	4.90	6.0	37.0	36.4	-.6
Services	2.42	4.99	7.5	34.7	32.8	-1.9

Table 2. Average hourly earnings, by industry division, as percent of total private nonagricultural payrolls, 1968 and 1978

Industry division	1968	Rank	1978	Rank
Mining	117.5	7	134.8	8
Construction	154.7	9	152.0	9
Durable goods, manufacturing	111.9	6	115.6	6
Nondurable goods, manufacturing	96.1	3	97.2	4
Transportation and public utilities	120.0	8	132.7	7
Wholesale trade	107.0	5	103.3	5
Retail trade	75.8	1	73.6	1
Finance, insurance, and real estate	96.5	4	86.1	2
Services	84.9	2	87.7	3

The slow pace of earnings growth in retail trade doubtlessly reflects the increase in the number of part-time workers, who are generally paid about the minimum wage. Voluntary part-time employment amounted to 26.1 percent in retail trade in 1968; by 1978, the proportion was 29.4 percent. The trend of yearly increase in average hourly earnings picked up slightly in manufacturing and trade after the cyclical peak in 1973, reflecting the discontinuation of wage and price controls on May 1, 1974. The annual rate of growth in durable manufacturing jumped from 6.4 in 1968–73 to 8.6 percent in 1974–78 and in nondurable manufacturing from 6.2 to 8.4 percent. In wholesale trade, earnings rose 5.9 percent and 7.6 percent. Similarly, in retail trade, the annual pace jumped from 6.2 to 7.6 percent.

Construction, in contrast, was the only industry division displaying a slowing in the annual rate of increase of earnings. After 1971 and the imposition of wage controls, the pace slowed to 6.1 percent compared with the 8.9 percent prevailing from 1968 through 1971. However, the tempo of increases in these 3 years was sharply above those in any of the other divisions.

Pronounced jumps in earnings occurred in the transportation and public utility industry in 1971, and in mining in 1972. In both cases, the increases were the aftereffect of strikes by railroad workers and coal miners. Earnings in mining rose again, and with vigor, in 1974, 1975, and 1978. These wage increases followed strike activity in 1974 (after economic controls were lifted), and again in 1978. Coal mining and construction accounted for a significant proportion (41 percent) of the workers involved in walkouts, and of all days lost to strikes in 1974 (35 percent). There was a 25.5-percent increase in mining earnings over the years 1974 and 1975. This is the largest consecutive 2-year increase recorded in any industry between 1968–78. □

[1] Hours referred to are paid but not necessarily worked, for example, paid holidays.

[1] The cyclical peaks and troughs are as defined by the National Bureau of Economic Research.

Occupational earnings in auto dealer repair shops

Average straight-time earnings of journeymen mechanics in auto dealer repair shops ranged from $7.42 in Memphis to over $10 an hour in Houston, San Francisco–Oakland, and Detroit, among 23 areas surveyed by the Bureau of Labor Statistics in June 1978. Earnings for lubricators, usually the lowest-paid group of workers among eight occupations studied in repair and parts departments, ranged from $3.38 in Philadelphia to $7.52 in Los Angeles–Long Beach. Painters ($6.24–$14.34) and body repairers ($7.72–$11.53) generally had the highest average hourly earnings among the surveyed jobs. Other groups surveyed and their salary ranges were: service mechanics ($4.80–$9.44), new-car get-ready workers ($4.01–$7.54), parts clerks ($4.76–$8.82), and service salesworkers ($5.61–$10.01).

Earnings in San Francisco–Oakland, Houston, and Detroit were typically among the highest reported; those in Boston, Memphis, Philadelphia, and Pittsburgh were generally among the lowest. The following tabulation illustrates the pay level relationships for the 23 areas studied (New York average equals 100), based on the combined averages for six of the repair shop occupations which were common to all areas:

Area	*Relative pay level*
San Francisco–Oakland	125–129
Houston	120–124
Detroit	115–119
Chicago, Los Angeles–Long Beach	110–114
Dallas–Ft. Worth, Denver–Boulder, St. Louis	105–109
Miami, Minneapolis–St. Paul, New York	100–104
Atlanta, Kansas City, Nassau–Suffolk, Portland, Washington	95–99
Birmingham, Indianapolis, Milwaukee	90–94
Boston, Memphis, Philadelphia, Pittsburgh	85–89

Also, hourly earnings relationships between occupations varied widely by area. For instance, in Kansas City, body repairers averaged 28 percent more than lubricators; in Detroit and Houston, they averaged about 75 percent more; and in Chicago, Philadelphia, Pittsburgh, Portland, and Washington, D.C., they earned more than twice as much.

Workers paid on an incentive basis accounted for about one-half of the production workers in the survey and nearly always averaged higher earnings than their time-rated counterparts. The prevalence of incentive pay also contributed to the wide dispersion of individual earnings within the same job and area. Auto body repairers and painters were most frequently paid on the basis of a flat rate percentage, receiving a stipulated proportion (usually 40 to 50 percent) of the labor cost charged to the customer; parts clerks and service salesworkers were virtually always on commission; and incentive workers in the four remaining occupations usually were under flat-rate-hours systems, in which pay is computed by multiplying the number of hours predetermined for each task by an established rate.

Both holidays and vacations with pay were provided for most workers in nearly all areas. Life, hospitalization, surgical, basic medical, and major medical insurance plans were provided to nine-tenths or more of the production workers in most areas. Retirement pension plans covered at least one-half the workers in only 10 of the 23 areas studied.

Individual reports for each of the areas in the survey were issued earlier and are available upon request from the Bureau of Labor Statistics or any of its regional offices. A comprehensive bulletin, *Industry Wage Survey: Auto Dealer Repair Shops, June 1978*, is available. □

Significant Decisions In Labor Cases

Safety first

Overruling two of the three appeals courts which have considered the issue, the Supreme Court recently approved a Labor Department regulation supplementing the explicit procedures of the Occupational Safety and Health Act of 1970 in order to fulfill the purposes of that act. Because OSHA was designed to protect workers and to require employers to eliminate workplace hazards, the Court upheld a regulation giving workers the right to refuse to perform hazardous jobs if they reasonably believe there is no other way to avoid risk of serious injury or death. However, the Court also made clear that employers had no obligation to pay workers for the time that they have refused to work. (*Whirlpool Corp. v. Marshall.*[1])

Following the death caused by a worker's stepping onto a wire mesh guard 20 feet above a factory floor, the Whirlpool Corp. issued a directive forbidding workers from standing on the mesh. Twelve days later, two workers were ordered onto the mesh (which they had already reported to OSHA, after their employer refused to repair it at their request) but refused to step on it. They were reprimanded and sent home without pay.

In the Supreme Court, both sides agreed that these workers' actions were covered by a Labor Department regulation providing:

> [A]s a general matter, there is no right afforded by the act which would entitle employees to walk off the job because of potential unsafe conditions at the workplace. . . . However, . . . if the employee, with no reasonable alternative, refuses in good faith to expose himself to the dangerous condition, he would be protected against subsequent discrimination. The condition causing the employee's apprehension of death or injury must be . . . reasonable . . .

In this case, the district court ruled that the regulation was invalid because it was not authorized by the OSHA statute. Although the Fifth and Tenth Circuits had ruled the same way in two similar cases,[2] the Sixth Circuit reversed.[3]

In upholding the Sixth Circuit's decision, the Supreme Court held that the Labor Department regulation "clearly conforms to the fundamental objective of the Act—to prevent occupational deaths and serious illnesses." Although OSHA does not mention a right to refuse to work under unsafe conditions, Justice Potter Stewart's opinion for a unanimous Court reasoned that the Secretary of Labor had the power to find such an implied right in the law because Congress had intended to prevent injuries and to require employers to eliminate dangers in the workplace:

> The regulation thus on its face appears to further the overriding purpose of the Act, and rationally to complement its remedial scheme. In the absence of some contrary indication in the legislative history, the Secretary's regulation must, therefore, be upheld, particularly when it is remembered that safety legislation is to be liberally construed to effectuate the congressional purpose.

Following a review of the legislative history, Stewart concluded that in rejecting earlier versions of the OSHA legislation granting workers and the Labor Department other specified rights, the Congress had not meant to prevent workers from refusing to perform hazardous jobs when they had no reasonable alternative. Similar rights have been found under the Federal Mine Safety and Health Act Amendments of 1977 and under the NLRA and the Labor Management Relations Act.[4]

The collegial bargain

The Supreme Court recently ruled that the faculty at Yeshiva University is not entitled to the collective bargaining rights provided "employees" under the National Labor Relations Act. In a close 5-to-4 decision, the Court rejected the assertion of the National Labor Relations Board that, within the authority structure of such academic institutions, faculty members are professional workers whose interests are separate from those of the institution. Instead, the Court found that Yeshiva's faculty acts in a managerial capacity "by taking or recommending discretionary actions that effectively control or implement employer policy." Thus, the Court concluded that the establishment of collective bargaining for most of the Yeshiva faculty would lead to a division of loyalty that Congress had sought to prevent. (*NLRB v. Yeshiva Univ.*[5])

In reaching its verdict, the Court established two crucial elements to support its interpretation of the managerial exclusion. First, Justice Lewis Powell's majority

---

"Significant Decisions in Labor Cases" is written by Gregory J. Mounts of the *Monthly Labor Review* staff.

opinion concluded that the Yeshiva faculty exercise authority which "in any other context" unquestionably would be managerial:

> . . . Their authority in academic matters is absolute. They decide what courses will be offered, when they will be scheduled, and to whom they will be taught. They debate and determine teaching methods, grading policies, and matriculation standards. They effectively decide which students will be admitted, retained, and graduated. On occasion their views have determined the size of the student body, the tuition to be charged, and the location of a school. When one considers the functions of a university, it is difficult to imagine decisions more managerial than these. To the extent the industrial analogy applies, the faculty determines within each school the product to be produced, the terms upon which it will be offered, and the customers who will be served.

In addition, the Court noted that the faculty members also play a predominant role in faculty hiring, tenure, sabbaticals, termination, and promotion. Thus, the Yeshiva faculty's functions represent the range of characteristics that make faculty jobs managerial in scope, rather than purely professional. At the other end of the scale, Powell noted that professors who merely "determine the content of their own courses, evaluate their own students, and supervise their own research" would not be subject to the managerial exclusion. Moreover, he suggested that the structure and operation of a school's faculty could provide a rational line—such as tenure—for distinguishing those who properly could be included in a bargaining unit. Powell even speculated that the Board might be able to make such distinctions among the Yeshiva faculty.

The second important element in Powell's majority opinion explicitly rejected the Board's argument that the Yeshiva faculty's role in decisionmaking is not managerial because it involves only the exercise of "independent professional judgment" in academic governance. Powell noted that the Board had implicitly rejected this criterion when it applied the managerial exclusion to certain professionals in other cases,[6] and he explained why it would be particularly inappropriate in a collegial setting:

> . . . [T]he Board's approach would undermine the goal it purports to serve: To ensure that employees who exercise discretionary authority on behalf of the employer will not divide their loyalty between employer and union. In arguing that a faculty member exercising independent judgment acts primarily in his own interest and therefore does not represent the interest of his employer, the Board assumes that the professional interests of the faculty and the interests of the institution are distinct, separable entities with which a faculty member could not simultaneously be aligned. The Court of Appeals found no justification for this distinction, and we perceive none. In fact, the faculty's professional interests—as applied to governance at a university like Yeshiva—cannot be separated from those of the institution. . . . Faculty members enhance their own standing and fulfill their professional mission by ensuring that the university's objectives are met. But there can be no doubt that the quest for academic excellence and institutional distinction is a "policy" to which the administration expects the faculty to adhere, whether it be defined as a professional or an institutional goal. It is fruitless to ask whether an employee is 'expected to conform' to one goal or another when the two are essentially the same.

Justice William Brennan, joined by Justices White, Blackmun, and Marshall, dissented from the Court's opinion. Not only did the majority exceed the Court's limited role in reviewing Board decisions, he wrote, but it reversed a reasonable policy conclusion resulting from an exhaustive analysis by the Board.

Brennan specifically objected to the majority's reasoning that the interests of the university and those of the faculty are inseparable. The congruence of their interests in certain academic and professional areas does abrogate the faculty's right to collective bargaining on issues where some conflict exists, he observed:

> . . . The very fact that Yeshiva's faculty has voted for the union . . . indicates that the faculty does not perceive its interests to be aligned with those of management. Indeed, on the precise topics which are specified as mandatory subjects of collective bargaining—wages, hours, and other terms and conditions of employment—the interests of teacher and administrator are often diametrically opposed. ☐

[3] *Marshall v. Whirlpool Corp.,* 593 F.2d 715 (6th Cir., 1979), see *Monthly Labor Review,* June 1979, pp. 44–45.

[4] According to the Court, the Secretary of Labor's interpretation of OSHA in this area "conforms to the interpretation that Congress clearly wished the courts to give the parallel antidiscrimination provision of the Federal Mine Safety and Health Amendments Act of 1977, 30 U.S.C. Sec. 801 *et seq.*" In addition, Sec. 7 of the National Labor Relations Act, 29 U.S.C. Sec. 157, provides employees a protected right to strike over safety issues. Similarly, Sec. 502 of the Labor Management Relations Act, 29 U.S.C. Sec. 143, provides that "the quitting of labor by an employee or employees in good faith because of abnormally dangerous conditions for work . . . [shall not] be deemed a strike." The effect of this section is to create an exception to a no-strike obligation in a collective bargaining contract.

Major Agreements Expiring Next Month

This list of collective bargaining agreements expiring in May is based on contracts on file in the Bureau's Office of Wages and Industrial Relations. The list includes agreements covering 1,000 workers or more.

Employer and location	Industry	Union[1]	Number of workers
Associated General Contractors of America, Inc.:			
Detroit Chapter, 3 agreements (Michigan)	Construction	Operating Engineers; Carpenters; and Teamsters (Ind.)	14,000
Detroit Chapter and 2 others (Michigan)	Construction	Bricklayers	3,300
Detroit Chapter and 1 other (Michigan)	Construction	Bricklayers; Plasterers; and Cement Masons	3,000
Detroit Chapter and 2 others (Michigan)	Construction	Iron Workers	2,200
Florida East Coast and Southern Florida Chapters	Construction	Operating Engineers	1,300
Idaho Branch (Interstate)	Construction	Laborers; Cement Masons; Carpenters; Operating Engineers; and Teamsters (Ind.)	4,750

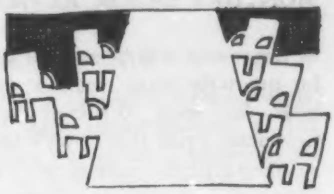
Developments in Industrial Relations



AFL–CIO invites Teamsters to reaffiliate

At its winter meeting, the Executive Council of the AFL–CIO affirmed its support of the revised anti-inflation program, extended an invitation to independent unions to join its ranks, and cleared the way for women to sit on its presently all-male council by lifting an eligibility restriction.

The anti-inflation program resulted from the 1979 national accord between the Carter Administration and organized labor. (See *Monthly Labor Review,* March 1980, p. 55.) The council stressed that if this voluntary program failed, it would press for mandatory controls on wages and prices. Prior to the national accord, which gave labor a greater voice in anti-inflation efforts, the AFL–CIO had opposed a voluntary plan, contending that it was more stringent for labor than business.

The council established a committee to negotiate a possible reaffiliation of the Teamsters union, which was expelled from the AFL–CIO in 1957 on charges of corruption. Federation President Lane Kirkland, who heads the 5-member committee, said that he has already had some discussions with Teamsters President Frank Fitzsimmons on the matter and is satisfied that the Teamsters are "a bona fide trade union that has been working in the best interest of its members."

Committees were not created to negotiate with the Auto Workers and Mine Workers unions on affiliation, but Kirkland noted that both unions (and the Teamsters) were now participating in weekly meetings on legislative goals at the AFL–CIO. Auto Workers President Douglas Fraser said he favored reaffiliation and that negotiations might start after the union's convention in June. The Auto Workers left the AFL–CIO in 1968, and the Mine Workers were never an affiliate.

The council moved to open its ranks to women and minority group members by waiving the requirement that only presidents and secretary-treasurers of unions are eligible for membership. The all-male 35-member council currently has one black member, Frederick O'Neal, president of the Actors and Artistes union. The council has never had a female member.

In other matters, the council decided to take a more active and direct role in organizing workers by establishing a unit to exchange information among affiliates on organizing tactics and techniques. Previously, the Federation generally limited its role to settling jurisdictional disputes among member unions. The change apparently resulted from the council's concern that unions represent a decreasing percentage of the Nation's workforce, despite some growth in the absolute number of workers they represent.

United States rejoining the ILO

The United States announced it will rejoin the International Labor Organization, ending a 2-year absence because "the organization had become increasingly anti-American and pro-Soviet." (See *Monthly Labor Review,* December 1977, p. 2.) A Cabinet-level committee monitoring the organization found that a majority of ILO members "have successfully . . . returned the ILO to its original purposes." The committee unanimously recommended that the United States return to the organization and work with other ILO members to ensure that the "true potential of the organization is realized."

The ILO was founded in 1919 to improve working conditions and labor standards and to promote human rights. Its members include representatives of labor, management, and government.

Tobacco settlements

Members of the Bakery, Confectionery and Tobacco Workers union approved 3-year wage and benefit contracts with Philip Morris, Liggett & Myers, Inc., and the American Tobacco Co.

The Philip Morris accord, which covered 8,500 workers in Richmond, Va., and Louisville, Ky., was negotiated according to the provisions of a 9-year "Long Term Agreement" (patterned after the Experimental Negotiating Agreement that controls bargaining in the steel industry) signed in May 1979. The Long Term Agreement prohibits strikes and lockouts; requires the company to give 18 months' notice of plant closings; provides for binding arbitration of issues that arise in the wage and benefit bargaining to be conducted at 3-year intervals; guarantees that the wage increases to

---

"Developments in Industrial Relations" is prepared by George Ruben and other members of the staff of the Division of Trends in Employee Compensation, Bureau of Labor Statistics, and is largely based on information from secondary sources.

be negotiated will be at least 3 percent a year; provides for quarterly wage escalator adjustments of 1 cent an hour for each 0.3-point movement in the BLS Consumer Price Index, with the escalator allowance to be automatically incorporated into base wage rates on February 1 of each year; provides for $300 bonus payments in May of each year; and makes a number of changes in the retirement plan, including a provision permitting an employee retiring at age 55 or later to receive the larger of a benefit computed according to the existing formula, or a benefit rate of $14 a month for each year of service for retirement from May 1979 through January 1980, $15 for retirement from February 1, 1980, through January 1981, and $16 for retirement on February 1, 1981, or later. The agreement also established an Income Protection Program under which laid-off employees will continue to receive their pay for a period ranging from 13 weeks for those with 1 but less than 2 years service to 52 weeks for those with 20 years or more. Also, laid-off workers will receive an additional week's pay for each year of service.

The 1980 Philip Morris "basic" agreement raised the 3-percent guaranteed minimum wage increases to 48 cents an hour on February 1, 1980, and 43 cents on February 1 of 1981 and 1982. There also were inequity adjustments for certain job classifications. The $1.34-an-hour cost-of-living allowance was incorporated into base rates, and the parties calculated that employees will receive 68, 70, and 72 cents in escalator adjustments in the respective contract years, based on assumed CPI rises of 9, 8.5, and 8 percent.

Other provisions include 4 weeks of paid vacation after 12 years of service (formerly 13), 5 weeks after 20 years (formerly 22), 6 weeks after 29 years (formerly 30), and the addition of a seventh week after 34 years; a twelfth annual paid holiday; various improvements in insurance benefits, such as $50,000 major medical coverage per individual (formerly $20,000), establishment of a vision care plan, with the company paying the full cost for employees and 75 percent for dependents, and sickness and accident benefits equal to 50 percent of base rate earnings up to $170 (formerly $115) a week.

Liggett & Myers and the American Tobacco Co. did not negotiate Long Term Agreements in 1979, but the American Tobacco contract generally provided for the same wage and benefit terms—except for the Income Protection Plan—as the Philip Morris agreements.

The Liggett & Myers accord differed in a number of areas. The wage terms consisted of an initial 48-cent increase and 25 cents "cost of living payments" on July 1 of 1981 and 1982 and on October 1, 1982. There was no provision for automatic quarterly escalator adjustments triggered by movement of the CPI. Also, there was no change in retirement benefits, paid holidays, or in the vacation schedule.

Steel workers accept reduced incentive pay

Employees of Wheeling-Pittsburgh Steel Corp.'s tube and sheet mill in Allenport, Pa., accepted a company proposal to reduce incentive pay over a 30-month period. The company said that the 10-step process would ultimately lower incentive earnings to a level "slightly above" the steel industry average. The plant has about 2,000 production and maintenance employees, 92 percent of whom are eligible for incentive pay. Despite the concession, Wheeling-Pittsburgh did not guarantee Steelworkers Local 1187 that the plant would remain open.

When Wheeling-Pittsburgh raised the issue in early December, it said that average incentive pay at the plant was 33 percent higher than at its competitors. The company also claimed that the competitors' employees were more productive, despite their lower incentive pay.

This development occurred shortly after plant closings and contract concessions involving 13,000 employees of United States Steel Corp. (See *Monthly Labor Review*, March 1980, p. 56.)

In a later development on the U.S. Steel closings, Steelworkers' locals in the Youngstown, Ohio, area filed suit in Federal District Court in Cleveland seeking to prevent the company from shutting down its McDonald Works in Youngstown. The locals contended that U.S. Steel had violated a verbal agreement to keep the works open as along as they were profitable and asked the court for access to the corporation's financial records to prove that the plants are profitable.

In another effort to avert the scheduled closing, the local unions were attempting to gain support for their proposal to purchase and modernize the mill. However, U.S. Steel said that it was dismantling the mill because it was obsolete. Also, doubts about the purchase plan were expressed by some members of the local industry development agency that is responsible for advising the U.S. Department of Commerce which projects should receive Federal loan guarantees.

Airline cuts managerial salaries

Trans World Airlines, which lost $56.4 million in the fourth quarter of 1979, cut the salaries of 800 management employees earning $35,000 or more. President Ed Meyer said that while the cut won't "save the airline," it is an indication of the seriousness of the situation and also serves to emphasize "how much we need a turnaround." He indicated that during the last 12 months the airline reduced employment from 36,000 to 34,000 to curtail costs. The salaries will be restored to their original levels—retroactive to the date of the cut—when the airline operates at a profit over a 12-month period.

Small oil refineries yield to union demands

Twelve small oil refineries settled with locals of the Oil, Chemical and Atomic Workers, but the union continued to strike the major oil companies and some other small refineries. The settlements covered about 1,700 workers out of the 60,000 that struck 100 companies when the parties were unable to reach agreement under a reopening provision of the contracts negotiated in 1979.

The settlements—which met the revised demands of the union—generally provided for a total wage increase of 5 percent plus 55 cents an hour, but not less than a combined total of $1 an hour, retroactive to January 1980 (the 5-percent portion was already scheduled for January 1980 under the 1979 settlement); a $125-a-month employer payment for medical insurance for families and a lesser amount for single employees; and establishment of dental coverage financed by employer payments of $20 a month for families and a lesser amount for single employees. There also were improvements in vacation benefits. At some companies, the new schedule provides for 5 weeks after 15 years of service, 6 weeks after 20 years, and 7 weeks after 25 years. Previously, the schedules generally provided for a maximum of 5 weeks of vacation after 20 years of service.

The refineries that had not settled generally objected to the health insurance and dental plan proposals, contending that they would be very costly, particularly because the companies would be required to assume any premium increases needed to maintain the uniform set of benefits specified in the union proposal.

At its peak, the strike involved refineries processing about 70 percent of the Nation's petroleum needs. However, the companies' white-collar employees continued to maintain operations by working extended schedules. According to the American Petroleum Institute, all U.S. refineries operated at 84.6 percent of capacity for the week that ended January 11; for the week that ended on January 25, output had declined to 80.5 percent of capacity, the "lowest in a long time," according to an official of the institute.

Four auto parts manufacturers settle

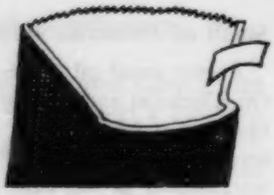
There was some progress in the Auto Workers negotiations with automobile parts manufacturers, as the union settled with four firms on contracts patterned after the 3-year General Motors Corp. contract. (See *Monthly Labor Review*, November 1979, pp. 58–59.) The accord with the Budd Co. ended a 2-week strike and covered 10,000 workers at seven plants in three States. The other agreements, reached without strikes, were with Rockwell International Corp.'s Automotive Group for 7,000 workers at 10 facilities in six States; with Champion Spark Plug Co. for 5,000 workers in three States and Canada; and with Kelsey-Hayes Co. for 1,500 workers in Michigan. The Kelsey-Hayes contract provided for the permanent withholding of 26 cents from wage escalator adjustments, compared with 14 cents at General Motors. The union agreed to the larger diversion because of higher pension costs to Kelsey-Hayes resulting from a higher ratio of retired to active employees.

The Auto Workers continued a strike against International Harvester Co. One of the major unresolved points was a company demand for more flexibility in mandating overtime work for employees to attain parity with Caterpillar Tractor Co. and Deere & Co., which had settled earlier.

Wood shavings—suspected carcinogen at GM

General Motors Corp. will underwrite medical evaluations and cancer tests for 1,800 wood-model makers. The Michigan Cancer Foundation, in a preliminary study of 1,073 employees who make wood models of cars, found 39 cases of cancer—a high rate, compared with 26 cases that could be expected in such a group. Robert Weincek, the company's medical director, said the employees work with no known carcinogens, although wood shavings are suspect. Some of the woodworkers have asserted that the cancers resulted from exposure to chemicals.

Book Reviews



A woman in a man's job

Frances Perkins: "That Woman in FDR's Cabinet!" By Lillian Holmen Mohr. Croton-on-Hudson, N.Y., North River Press, Inc., 1979. 328 pp., bibliography. $14.95.

This is a superb brief biography of Frances Perkins, first woman ever to be a member of a U.S. President's Cabinet. "That woman in FDR's Cabinet" served as Secretary of Labor for 12 years between 1933 and 1945. During the Great Depression of the 1930's, when unemployment was crucial, the role of the Secretary of Labor was particularly important. Madam Secretary faced problems not unlike those of today—job opportunities, job safety, and fair labor standards. Strikingly different, however, was the issue of deflation, for at that time the government *reinflated* the economy in order to drive up prices and wages. Frances Perkins was a great Secretary of Labor who made the Department a seed bed of social progress. She was a prime mover in winning social security for the elderly, unemployment insurance, abolition of oppressive child labor, minimum wage laws (25 cents an hour), the right to bargain collectively, and other progressive programs.

Lillian Holmen Mohr writes well and in a popular style. To some extent, Mohr tells the story the same way that Frances Perkins would have told it. And Frances Perkins had a way with words. But, the relatively simple language which makes the book interesting to an average reader should not hide the fact of very impressive research from a wide variety of sources.

Frances Perkins hated being praised because she was a woman in what was then considered a man's job. Often, when asked whether her sex made a difference, she replied, "only in climbing trees." She preferred winning recognition on the basis of her work. She was an intelligent and experienced person, well equipped for the position of Secretary of Labor to which she had been appointed.

Mohr does a good job in compressing Frances Perkins' 85 years of life into less than 300 pages. Born Fannie Caralie Perkins on April 10, 1880, she went to Mount Holyoke College at a time that not many women went to college. She distinguished herself as a social worker, reformer, chairman of the Industrial Board in New York State, and head of the State Labor Department. Perhaps Mohr makes too much of Perkins' activity in the cause of women's rights and in consumer protection (or perhaps this reviewer is revealing his own prejudices). However, the several references to the distinguished Alice Hamilton, Charlotte Perkins Gilman, and other important women are fascinating.

The book is relatively free of errors, though there are a few, such as calling Assistant Secretary of Labor Edward McGrady Under Secretary before such a post existed, and getting the date of the Homestead strike wrong on page 167 and right on page 240.

In 1976, George Martin wrote a splendid biography: *Madam Secretary: Frances Perkins.* It is a much longer book. It was a major historical and biographical contribution. Mohr's new book is much shorter but equally interesting and useful. The small publishing house with no promotion and the $14.95 price are likely to deprive Mohr's biography of the wide audience it deserves. Hopefully, some publisher will put out a reasonably priced paperback edition.

U.S. Department of Labor

English for doctoral candidates

A Popularized Version of 21 Doctoral Dissertations. (Prepared by Lawrence R. Klein and Susan Ghozeil.) Washington, U.S. Department of Labor, Employment and Training Administration, 1979. 113 pp. (R&D Monograph 70.) $3.50, Superintendent of Documents, Washington 20402.

The wall of Lawrence R. Klein's office, while he was editor of this journal, bore this quotation attributed to H. G. Wells: "No passion in the world, no love or hate, is equal to the passion to alter someone else's draft." Klein practiced that passion for 22 years at the *Monthly Labor Review.* This little volume proves that his ardor has not cooled.

The book is the third prepared by Klein, now adjunct professor of economics at the University of Arizona, designed to make available to a broad audience findings from dissertations in the social and behavioral sciences.

Over the past 15 years, the U.S. Department of Labor's Employment and Training Administration has financially supported more than 500 such dissertations, many of which, as Klein puts it, may result in a journal article or two, if the authors are lucky, "and then blush unseen and waste their substance in the desert air of a library, and perhaps become footnotes in somebody else's dissertation." Klein and Howard Rosen, director of research for the Employment and Training Administration, were convinced that the years of work and thought that had gone into these dissertations could be useful to nonacademics if the documents could be translated into readable and understandable English. Klein's first two efforts went part way in that direction, cutting the dissertations down to about 2,500 words, but leaving in much of the original language. For the present volume, Klein and his coauthor, Susan Ghozeil, have rewritten 21 dissertations into relatively simple language, without jargon and without mathematical equations.

To get a sense of the kind of service the authors have rendered, contemplate this sentence from one of the dissertations they considered for the book:

> Extrapolating from cross-sectional data, we infer that transformations in the clustering of roles occur during the careers of engineers and scientists, with progressively greater involvement in teaching in evidence as they move through the career sequence; increasingly less involvement in both basic and applied research; and increasingly greater likelihood of administrative, managerial, and supervisory duties occurring in the middle stages of the career.

And the translation offered by the authors:

> As scientists and engineers get older, they are more likely to teach and less likely to do research, but their roles as supervisors most often come in the middle stages of their careers.

The 21 dissertations summarized in this volume include studies of job search, unemployment insurance, labor market segmentation, the dual labor market, construction industry wages, the 4-day workweek, and stresses on and off the job. One of the topics that may be of particular interest at the moment is an economic analysis of conscription vs. all-volunteer armed forces in peacetime. Aside from an occasional penchant for an over-cute title or phrase, the authors do an excellent job of communicating the results of the Ph. D.s' research.

But the authors go beyond that, commenting critically on the state of the Ph. D. dissertation today. The quality of writing and the gradual abandonment of verbal for mathematical symbols, they say, are but a symptom of a larger problem with the dissertation and its potential usefulness.

> The doctoral thesis should be the capstone of formal academic training, the measure and very symbol of learning in a classical sense. It should be the mark of the broadly educated person. Yet the outstanding features are its narrowness, its frequent purblind avoidance of interdisciplinary interest and lack of literary grace or niceties, its seeming disinterest in the relationship of theme to broad movements of history and social development. In short, it is barren of the philosophy that gives substance and grandeur to the symbol Ph.D. Has the title become a cliche, divorced from both meaning and significance, the shining ideal tarnished by the dross of specialization? Is today's Ph.D.—let's say in economics—truly educated or just a finely trained and sharply honed specialist-technician who is skilled in mathematical statistics, regression analysis, and the accepted truisms of the market?

Ph. D. candidates and their advisers need to ponder these questions. They also should examine the good writing in this book and emulate it.

Current Labor Statistics

Notes on Current Labor Statistics 70

Schedule of release dates for major BLS statistical series 70

Employment data from household survey. Definitions and notes 71
1. Employment status of noninstitutional population, selected years, 1950–79 71
2. Employment status by sex, age, and race, seasonally adjusted 72
3. Selected employment indicators, seasonally adjusted 73
4. Selected unemployment indicators, seasonally adjusted 74
5. Unemployment rates, by sex and age, seasonally adjusted 75
6. Unemployed persons, by reason for unemployment, seasonally adjusted 75
7. Duration of unemployment, seasonally adjusted 75

Employment, hours, and earnings data from establishment surveys. Definitions and notes 76
8. Employment by industry, 1950–79 77
9. Employment by State 77
10. Employment by industry division and major manufacturing group 78
11. Employment by industry division and major manufacturing group, seasonally adjusted 79
12. Labor turnover rates in manufacturing, 1976 to date 80
13. Labor turnover rates in manufacturing, by major industry group 80
14. Hours and earnings, by industry division, 1948–79 81
15. Weekly hours, by industry division and major manufacturing group 82
16. Weekly hours, by industry division and major manufacturing group, seasonally adjusted 83
17. Hourly earnings, by industry division and major manufacturing group 84
18. Hourly Earnings Index, by industry division 84
19. Weekly earnings, by industry division and major manufacturing group 85
20. Gross and spendable weekly earnings in current and 1967 dollars, 1960 to date 86

Unemployment insurance data. Definitions and notes 87
21. Unemployment insurance and employment service operations 87

Price data. Definitions and notes 88
22. Consumer Price Indexes, 1967–79 89
23. Consumer Price Index, U.S. city average, general summary and selected items 89
24. Consumer Price Index, cross classification of region and population size class 95
25. Consumer Price Index, selected areas 96
26. Producer Price Indexes, by stage of processing 97
27. Producer Price Indexes, by commodity grouping 98
28. Producer Price Indexes, for special commodity groupings 100
29. Producer Price Indexes, by durability of product 100
30. Price indexes for the output of selected SIC industries 100

Productivity data. Definitions and notes 103
31. Indexes of productivity and related data, 1950–79 103
32. Annual percent change in productivity and related data, 1969–79 104
33. Indexes of productivity, hourly compensation, and unit costs 104
34. Percent change in productivity, hourly compensation, and unit costs 105

Labor-management data. Definitions and notes 106
35. Wage and benefit settlements in major collective bargaining units 106
36. Effective wage rate adjustments going into effect in major collective bargaining units 107
37. Work stoppages, 1947 to date 107

NOTES ON CURRENT LABOR STATISTICS

This section of the *Review* presents the principal statistical series collected and calculated by the Bureau of Labor Statistics. A brief introduction to each group of tables provides definitions, notes on the data, sources, and other material usually found in footnotes.

Readers who need additional information are invited to consult the BLS regional offices listed on the inside front cover of this issue of the *Review*. Some general notes applicable to several series are given below.

Seasonal adjustment. Certain monthly and quarterly data are adjusted to eliminate the effect of such factors as climatic conditions, industry production schedules, opening and closing of schools, holiday buying periods, and vacation practices, which might otherwise mask short-term movements of the statistical series. Tables containing these data are identified as "seasonally adjusted." Seasonal effects are estimated on the basis of past experience. When new seasonal factors are computed each year, revisions may affect seasonally adjusted data for several preceding years. For a technical discussion of the method used to make seasonal adjustments, see "Appendix A. The BLS Seasonal Factor Method," *BLS Handbook of Methods for Surveys and Studies*, Bulletin 1910 (Bureau of Labor Statistics, 1976), pp. 272–78, and *X-11 Variant of the Census Method II Seasonal Adjustment Program*, Technical Paper No. 15 (Bureau of the Census, 1967). Seasonally adjusted labor force data in tables 2–7 were last revised in the February 1980 issue of the *Review* to reflect the preceding year's experience. Beginning in January 1980, the BLS introduced two major modifications in the seasonal adjustment methodology for labor force data. First, the data are being seasonally adjusted with a new procedure called X-11/ARIMA, which was developed at Statistics Canada as an extension of the standard X-11 method. A detailed description of the procedure appears in *The X-11 ARIMA Seasonal Adjustment Method* by Estela Bee Dagum (Statistics Canada Catalogue No. 12-564E, September 1979).

The second change is that seasonal factors are now being calculated for use during the first 6 months of the year, rather than for the entire year, and then are calculated at mid-year for the July-December period. Revisions of historical data continue to be made only at the end of each calendar year. Annual revision of the seasonally adjusted payroll data in tables 11, 13, 16, and 18 was last introduced in the November 1979 issue of the *Review*. New seasonal factors for productivity data in tables 33 and 34 are usually introduced in the September issue. Seasonally adjusted indexes and percent changes from month to month and from quarter to quarter are published for numerous Consumer and Producer Price Index series. However, seasonally adjusted indexes are not published for the U.S. average All Items CPI. Only seasonally adjusted percent changes are available for this series.

Adjustments for price changes. Some data are adjusted to eliminate the effect of changes in price. These adjustments are made by dividing current dollar values by the Consumer Price Index or the appropriate component of the index, then multiplying by 100. For example, given a current hourly wage rate of $3 and a current price index number of 150, where 1967 = 100, the hourly rate expressed in 1967 dollars is $2 ($3/150 × 100 = $2). The resulting values are described as "real," "constant," or "1967" dollars.

Availability of information. Data that supplement the tables in this section are published by the Bureau of Labor Statistics in a variety of sources. Press releases provide the latest statistical information published by the Bureau; the major recurring releases are published according to the schedule given below. The *Handbook of Labor Statistics 1978*, Bulletin 2000, provides more detailed data and greater historical coverage for most of the statistical series presented in the *Monthly Labor Review*. More information from the household and establishment surveys is provided in *Employment and Earnings*, a monthly publication of the Bureau, and in two comprehensive data books issued annually—*Employment and Earnings, United States* and *Employment and Earnings, States and Areas*. More detailed information on wages and other aspects of collective bargaining appears in the monthly periodical, *Current Wage Developments*. More detailed price information is published each month in the periodicals, the *CPI Detailed Report* and *Producer Prices and Price Indexes*.

Symbols

p = preliminary. To improve the timeliness of some series, preliminary figures are issued based on representative but incomplete returns.
r = revised. Generally this revision reflects the availability of later data but may also reflect other adjustments.
n.e.c. = not elsewhere classified.

Schedule of release dates for major BLS statistical series

Title and frequency (monthly except where indicated)	Release date	Period covered	Release date	Period covered	MLR table number
Employment situation	April 4	March	May 2	April	1–11
Producer Price Indexes	April 4	March	May 9	April	26–30
Consumer Price Index	April 22	March	May 23	April	22–25
Real earnings	April 22	March	May 23	April	14–20
Major collective bargaining settlements (quarterly)	April 25	1st quarter	....	....	35–36
Productivity and costs (quarterly)					
Nonfarm business and manufacturing	April 25	1st quarter	....	....	31–34
Nonfinancial corporations	....	....	May 28	1st quarter	31–34
Work stoppages	April 29	March	May 28	April	37
Labor turnover in manufacturing	April 30	March	May 30	April	12–13

EMPLOYMENT DATA FROM THE HOUSEHOLD SURVEY

EMPLOYMENT DATA in this section are obtained from the Current Population Survey, a program of personal interviews conducted monthly by the Bureau of the Census for the Bureau of Labor Statistics. The sample consists of about 65,000 households beginning in January 1980, selected to represent the U.S. population 16 years of age and older. Households are interviewed on a rotating basis, so that three-fourths of the sample is the same for any 2 consecutive months.

Definitions

Employed persons are (1) those who worked for pay any time during the week which includes the 12th day of the month or who worked unpaid for 15 hours or more in a family-operated enterprise and (2) those who were temporarily absent from their regular jobs because of illness, vacation, industrial dispute, or similar reasons. A person working at more than one job is counted only in the job at which he or she worked the greatest number of hours.

Unemployed persons are those who did not work during the survey week, but were available for work except for temporary illness and had looked for jobs within the preceding 4 weeks. Persons who did not look for work because they were on layoff or waiting to start new jobs within the next 30 days are also counted among the unemployed. The **unemployment rate** represents the number unemployed as a percent of the civilian labor force.

The **civilian labor force** consists of all employed or unemployed persons in the civilian noninstitutional population: the **total labor force** includes military personnel. Persons **not in the labor force** are those not classified as employed or unemployed; this group includes persons retired, those engaged in their own housework, those not working while attending school, those unable to work because of longterm illness, those discouraged from seeking work because of personal or job market factors, and those who are voluntarily idle. The **noninstitutional population** comprises all persons 16 years of age and older who are not inmates of penal or mental institutions, sanitariums, or homes for the aged, infirm, or needy.

Full-time workers are those employed at least 35 hours a week; **part-time workers** are those who work fewer hours. Workers on part-time schedules for economic reasons (such as slack work, terminating or starting a job during the week, material shortages, or inability to find full-time work) are among those counted as being on full-time status, under the assumption that they would be working full time if conditions permitted. The survey classifies unemployed persons in full-time or part-time status by their reported preferences for full-time or part-time work.

Notes on the data

From time to time, and especially after a decennial census, adjustments are made in the Current Population Survey figures to correct for estimating errors during the preceding years. These adjustments affect the comparability of historical data presented in table 1. A description of these adjustments and their effect on the various data series appear in the Explanatory Notes of *Employment and Earnings*.

Data in tables 2–7 are seasonally adjusted, based on the seasonal experience through December 1979.

1. Employment status of the noninstitutional population, 16 years and over, selected years, 1950–79

[Numbers in thousands]

Year	Total non-institutional population	Total labor force		Civilian labor force						Not in labor force
